

## NAG Library Function Document

### nag\_quad\_1d\_gauss\_wset (d01tbc)

## 1 Purpose

nag\_quad\_1d\_gauss\_wset (d01tbc) returns the weights and abscissae appropriate to a Gaussian quadrature formula with a specified number of abscissae. The formulae provided are for Gauss–Legendre, rational Gauss, Gauss–Laguerre and Gauss–Hermite.

## 2 Specification

```
#include <nag.h>
#include <nagd01.h>
void nag_quad_1d_gauss_wset (Nag_QuadType quad_type, double a, double b,
    Integer n, double weight[], double abscis[], NagError *fail)
```

## 3 Description

nag\_quad\_1d\_gauss\_wset (d01tbc) returns the weights and abscissae for use in the Gaussian quadrature of a function  $f(x)$ . The quadrature takes the form

$$S = \sum_{i=1}^n w_i f(x_i)$$

where  $w_i$  are the weights and  $x_i$  are the abscissae (see Davis and Rabinowitz (1975), Fröberg (1970), Ralston (1965) or Stroud and Secrest (1966)).

Weights and abscissae are available for Gauss–Legendre, rational Gauss, Gauss–Laguerre and Gauss–Hermite quadrature, and for a selection of values of  $n$  (see Section 5).

(a) Gauss–Legendre Quadrature:

$$S \simeq \int_a^b f(x) dx$$

where  $a$  and  $b$  are finite and it will be exact for any function of the form

$$f(x) = \sum_{i=0}^{2n-1} c_i x^i.$$

(b) Rational Gauss quadrature, adjusted weights:

$$S \simeq \int_a^\infty f(x) dx \quad (a + b > 0) \quad \text{or} \quad S \simeq \int_{-\infty}^a f(x) dx \quad (a + b < 0)$$

and will be exact for any function of the form

$$f(x) = \sum_{i=2}^{2n+1} \frac{c_i}{(x+b)^i} = \frac{\sum_{i=0}^{2n-1} c_{2n+1-i} (x+b)^i}{(x+b)^{2n+1}}.$$

(c) Gauss–Laguerre quadrature, adjusted weights:

$$S \simeq \int_a^\infty f(x) dx \quad (b > 0) \quad \text{or} \quad S \simeq \int_{-\infty}^a f(x) dx \quad (b < 0)$$

and will be exact for any function of the form

$$f(x) = e^{-bx} \sum_{i=0}^{2n-1} c_i x^i.$$

(d) Gauss–Hermite quadrature, adjusted weights:

$$S \simeq \int_{-\infty}^{+\infty} f(x) dx$$

and will be exact for any function of the form

$$f(x) = e^{-b(x-a)^2} \sum_{i=0}^{2n-1} c_i x^i \quad (b > 0).$$

(e) Gauss–Laguerre quadrature, normal weights:

$$S \simeq \int_a^{\infty} e^{-bx} f(x) dx \quad (b > 0) \quad \text{or} \quad S \simeq \int_{-\infty}^a e^{-bx} f(x) dx \quad (b < 0)$$

and will be exact for any function of the form

$$f(x) = \sum_{i=0}^{2n-1} c_i x^i.$$

(f) Gauss–Hermite quadrature, normal weights:

$$S \simeq \int_{-\infty}^{+\infty} e^{-b(x-a)^2} f(x) dx$$

and will be exact for any function of the form

$$f(x) = \sum_{i=0}^{2n-1} c_i x^i.$$

**Note:** the Gauss–Legendre abscissae, with  $a = -1$ ,  $b = +1$ , are the zeros of the Legendre polynomials; the Gauss–Laguerre abscissae, with  $a = 0$ ,  $b = 1$ , are the zeros of the Laguerre polynomials; and the Gauss–Hermite abscissae, with  $a = 0$ ,  $b = 1$ , are the zeros of the Hermite polynomials.

## 5 Arguments

1: <b>quad_type</b> – Nag_QuadType	<i>Input</i>
<i>On entry:</i> indicates the quadrature formula.	
<b>quad_type</b> = Nag_Quad_Gauss_Legendre	
Gauss–Legendre quadrature on a finite interval, using normal weights.	
<b>quad_type</b> = Nag_Quad_Gauss_Laguerre	
Gauss–Laguerre quadrature on a semi-infinite interval, using normal weights.	
<b>quad_type</b> = Nag_Quad_Gauss_Laguerre_Adjusted	
Gauss–Laguerre quadrature on a semi-infinite interval, using adjusted weights.	

**quad\_type** = Nag\_Quad\_Gauss\_Hermite  
 Gauss–Hermite quadrature on an infinite interval, using normal weights.

**quad\_type** = Nag\_Quad\_Gauss\_Hermite\_Adjusted  
 Gauss–Hermite quadrature on an infinite interval, using adjusted weights.

**quad\_type** = Nag\_Quad\_Gauss\_Rational\_Adjusted  
 Rational Gauss quadrature on a semi-infinite interval, using adjusted weights.

*Constraint:* **quad\_type** = Nag\_Quad\_Gauss\_Legendre, Nag\_Quad\_Gauss\_Laguerre,  
 Nag\_Quad\_Gauss\_Laguerre\_Adjusted, Nag\_Quad\_Gauss\_Hermite,  
 Nag\_Quad\_Gauss\_Hermite\_Adjusted or Nag\_Quad\_Gauss\_Rational\_Adjusted.

2: **a** – double *Input*  
 3: **b** – double *Input*

*On entry:* the quantities  $a$  and  $b$  as described in the appropriate sub-section of Section 3.

*Constraints:*

if **quad\_type** = Nag\_Quad\_Gauss\_Rational\_Adjusted,  $\mathbf{a} + \mathbf{b} \neq 0.0$ ;  
 if **quad\_type** = Nag\_Quad\_Gauss\_Laguerre or Nag\_Quad\_Gauss\_Laguerre\_Adjusted,  
 $\mathbf{b} \neq 0.0$ ;  
 if **quad\_type** = Nag\_Quad\_Gauss\_Hermite or Nag\_Quad\_Gauss\_Hermite\_Adjusted,  $\mathbf{b} > 0.0$ .

*Constraints:*

Rational Gauss:  $\mathbf{a} + \mathbf{b} \neq 0.0$ ;  
 Gauss–Laguerre:  $\mathbf{b} \neq 0.0$ ;  
 Gauss–Hermite:  $\mathbf{b} > 0$ .

4: **n** – Integer *Input*

*On entry:*  $n$ , the number of weights and abscissae to be returned.

*Constraint:*  $n = 1, 2, 3, 4, 5, 6, 8, 10, 12, 14, 16, 20, 24, 32, 48$  or  $64$ .

**Note:** if  $n > 0$  and is not a member of the above list, the maximum value of  $n$  stored below  $n$  will be used, and all subsequent elements of **abscis** and **weight** will be returned as zero.

5: **weight[n]** – double *Output*

*On exit:* the  $n$  weights.

6: **abscis[n]** – double *Output*

*On exit:* the  $n$  abscissae.

7: **fail** – NagError \* *Input/Output*

The NAG error argument (see Section 3.6 in the Essential Introduction).

## 6 Error Indicators and Warnings

### NE\_BAD\_PARAM

The value of **a** and/or **b** is invalid for the chosen **quad\_type**. Either:

On entry, argument  $\langle\text{value}\rangle$  had an illegal value.

The value of **a** and/or **b** is invalid for Gauss–Hermite quadrature.

On entry, **quad\_type** =  $\langle\text{value}\rangle$ .

On entry, **a** =  $\langle\text{value}\rangle$  and **b** =  $\langle\text{value}\rangle$ .

Constraint:  $\mathbf{b} > 0.0$ .

The value of **a** and/or **b** is invalid for Gauss–Laguerre quadrature.

On entry, **quad\_type** = *<value>*.

On entry, **a** = *<value>* and **b** = *<value>*.

Constraint:  $|b| > 0.0$ .

The value of **a** and/or **b** is invalid for rational Gauss quadrature.

On entry, **quad\_type** = *<value>*.

On entry, **a** = *<value>* and **b** = *<value>*.

Constraint:  $|a + b| > 0.0$ .

## NE\_INT

On entry, **n** = *<value>*.

Constraint: **n** > 0.

## NE\_INTERNAL\_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

## NE\_QUAD\_GAUSS\_NPTS\_RULE

The **n**-point rule is not among those stored.

On entry: **n** = *<value>*.

**n**-rule used: **n** = *<value>*.

## NE\_TOO\_SMALL

Underflow occurred in calculation of normal weights.

Reduce **n** or use adjusted weights: **n** = *<value>*.

## NE\_WEIGHT\_ZERO

No nonzero weights were generated for the provided parameters.

## 7 Accuracy

The weights and abscissae are stored for standard values of **a** and **b** to full machine accuracy.

## 8 Parallelism and Performance

Not applicable.

## 9 Further Comments

Timing is negligible.

## 10 Example

This example returns the abscissae and (adjusted) weights for the six-point Gauss–Laguerre formula.
