## nag\_5d\_shep\_eval (e01tnc)

### 1 Purpose

nag\_5d\_shep\_eval (e01tnc) evaluates the five-dimensional interpolating function generated by nag\_5d\_shep\_interp (e01tnc) and its first partial derivatives.

### 2 Specification

```
#include <nag.h>
#include <nage01.h>

void nag_5d_shep_eval (Integer m, const double x[], const double f[],
    const Integer iq[], const double rq[], Integer n, const double xe[],
    double q[], double qx[], NagError *fail)
```

### 3 Description

nag\_5d\_shep\_eval (e01tnc) takes as input the interpolant  $Q(\mathbf{x})$ ,  $\mathbf{x} \in \mathbb{R}^5$  of a set of scattered data points  $(\mathbf{x}_r, f_r)$ , for  $r = 1, 2, \dots, m$ , as computed by nag\_5d\_shep\_interp (e01tnc), and evaluates the interpolant and its first partial derivatives at the set of points  $\mathbf{x}_i$ , for  $i = 1, 2, \dots, n$ .

nag\_5d\_shep\_eval (e01tnc) must only be called after a call to nag\_5d\_shep\_interp (e01tnc).

nag\_5d\_shep\_eval (e01tnc) is derived from the new implementation of QS3GRD described by Renka (1988). It uses the modification for five-dimensional interpolation described by Berry and Minser (1999).

### 5 Arguments

- 1: **m** – Integer *Input*  
*On entry:* **must** be the same value supplied for argument **m** in the preceding call to nag\_5d\_shep\_interp (e01tnc).  
*Constraint:*  $\mathbf{m} \geq 23$ .
- 2: **x**[5 × **m**] – const double *Input*  
**Note:** the  $(i, j)$ th element of the matrix  $X$  is stored in  $\mathbf{x}[(j - 1) \times 5 + i - 1]$ .  
*On entry:* **must** be the same array supplied as argument **x** in the preceding call to nag\_5d\_shep\_interp (e01tnc). It **must** remain unchanged between calls.
- 3: **f**[**m**] – const double *Input*  
*On entry:* **must** be the same array supplied as argument **f** in the preceding call to nag\_5d\_shep\_interp (e01tnc). It **must** remain unchanged between calls.

- 4: **iq**[ $2 \times m + 1$ ] – const Integer *Input*  
*On entry:* **must** be the same array returned as argument **iq** in the preceding call to nag\_5d\_shep\_interp (e01tnc). It **must** remain unchanged between calls.
- 5: **rq**[ $21 \times m + 11$ ] – const double *Input*  
*On entry:* **must** be the same array returned as argument **rq** in the preceding call to nag\_5d\_shep\_interp (e01tnc). It **must** remain unchanged between calls.
- 6: **n** – Integer *Input*  
*On entry:* *n*, the number of evaluation points.  
*Constraint:*  $n \geq 1$ .
- 7: **xe**[ $5 \times n$ ] – const double *Input*  
**Note:** the (*i*, *j*)th element of the matrix is stored in **xe**[(*j* – 1) × 5 + *i* – 1].  
*On entry:* **xe**[(*i* – 1) × 5], ..., **xe**[(*i* – 1) × 5 + 4] must be set to the evaluation point  $\mathbf{x}_i$ , for  $i = 1, 2, \dots, n$ .
- 8: **q**[*n*] – double *Output*  
*On exit:* **q**[*i* – 1] contains the value of the interpolant, at  $\mathbf{x}_i$ , for  $i = 1, 2, \dots, n$ . If any of these evaluation points lie outside the region of definition of the interpolant the corresponding entries in **q** are set to the largest machine representable number (see nag\_real\_largest\_number (X02ALC)), and nag\_5d\_shep\_eval (e01tnc) returns with **fail.code** = NE\_BAD\_POINT.
- 9: **qx**[ $5 \times n$ ] – double *Output*  
**Note:** the (*i*, *j*)th element of the matrix is stored in **qx**[(*j* – 1) × 5 + *i* – 1].  
*On exit:* **qx**[(*i* – 1) × 5 + *j* – 1] contains the value of the partial derivatives with respect to  $\mathbf{x}_j$  of the interpolant  $Q(\mathbf{x})$  at  $\mathbf{x}_i$ , for  $i = 1, 2, \dots, n$ , and for each of the five partial derivatives  $j = 1, 2, 3, 4, 5$ . If any of these evaluation points lie outside the region of definition of the interpolant, the corresponding entries in **qx** are set to the largest machine representable number (see nag\_real\_largest\_number (X02ALC)), and nag\_5d\_shep\_eval (e01tnc) returns with **fail.code** = NE\_BAD\_POINT.
- 10: **fail** – NagError \* *Input/Output*  
The NAG error argument (see Section 3.6 in the Essential Introduction).

## 6 Error Indicators and Warnings

### NE\_BAD\_PARAM

On entry, argument *<value>* had an illegal value.

### NE\_BAD\_POINT

On entry, at least one evaluation point lies outside the region of definition of the interpolant. At all such points the corresponding values in **q** and **qx** have been set to nag\_real\_largest\_number: nag\_real\_largest\_number = *<value>*.

### NE\_INT

On entry, **m** = *<value>*.  
Constraint:  $m \geq 23$ .

On entry, **n** = *<value>*.  
Constraint:  $n \geq 1$ .

**NE\_INT\_ARRAY**

On entry, values in **iq** appear to be invalid. Check that **iq** has not been corrupted between calls to `nag_5d_shep_interp` (e01tmc) and `nag_5d_shep_eval` (e01tnc).

**NE\_INTERNAL\_ERROR**

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

**NE\_REAL\_ARRAY**

On entry, values in **rq** appear to be invalid. Check that **rq** has not been corrupted between calls to `nag_5d_shep_interp` (e01tmc) and `nag_5d_shep_eval` (e01tnc).

**7 Accuracy**

Computational errors should be negligible in most practical situations.

**8 Parallelism and Performance**

`nag_5d_shep_eval` (e01tnc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

`nag_5d_shep_eval` (e01tnc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the Users' Note for your implementation for any additional implementation-specific information.

**9 Further Comments**

The time taken for a call to `nag_5d_shep_eval` (e01tnc) will depend in general on the distribution of the data points. If the data points are approximately uniformly distributed, then the time taken should be only  $O(n)$ . At worst  $O(mn)$  time will be required.

**10 Example**

This program evaluates the function

$$f(\mathbf{x}) = \frac{(1.25 + \cos(5.4x_5)) \cos(6x_1) \cos(6x_2) \cos(6x_3)}{6 + 6(3x_4 - 1)^2}$$

at a set of 30 randomly generated data points and calls `nag_5d_shep_interp` (e01tmc) to construct an interpolating function  $Q(\mathbf{x})$ . It then calls `nag_5d_shep_eval` (e01tnc) to evaluate the interpolant at a set of random points.

To reduce the time taken by this example, the number of data points is limited to 30. Increasing this value to the suggested minimum of 4000 improves the interpolation accuracy at the expense of more time.

See also Section 10 in `nag_5d_shep_interp` (e01tmc).
