# NAG Library Function Document

# nag_zsytri (f07nwc)

## 1 Purpose

nag_zsytri (f07nwc) computes the inverse of a complex symmetric matrix $A$, where $A$ has been factorized by nag_zsytrf (f07nrc).

## 2 Specification

```
#include <nag.h>
#include <nagf07.h>
void nag_zsytri (Nag_OrderType order, Nag_UploType uplo, Integer n,
     Complex a[], Integer pda, const Integer ipiv[], NagError *fail)
```

## 3 Description

nag_zsytri (f07nwc) is used to compute the inverse of a complex symmetric matrix $A$, the function must be preceded by a call to nag_zsytrf (f07nrc), which computes the Bunch–Kaufman factorization of $A$.

If **uplo** = Nag_Upper, $A = PUDU^{\mathrm{T}}P^{\mathrm{T}}$ and $A^{-1}$ is computed by solving $U^{\mathrm{T}}P^{\mathrm{T}}XPU = D^{-1}$ for $X$.

If **uplo** = Nag_Lower, $A = PLDL^{\mathrm{T}}P^{\mathrm{T}}$ and $A^{-1}$ is computed by solving $L^{\mathrm{T}}P^{\mathrm{T}}XPL = D^{-1}$ for $X$.

## 5 Arguments

1: **order** – Nag_OrderType *Input*

*On entry*: the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

*Constraint*: **order** = Nag_RowMajor or Nag_ColMajor.

2: **uplo** – Nag_UploType *Input*

*On entry*: specifies how $A$ has been factorized.

**uplo** = Nag_Upper
$A = PUDU^{\mathrm{T}}P^{\mathrm{T}}$, where $U$ is upper triangular.

**uplo** = Nag_Lower
$A = PLDL^{\mathrm{T}}P^{\mathrm{T}}$, where $L$ is lower triangular.

*Constraint*: **uplo** = Nag_Upper or Nag_Lower.

3: **n** – Integer *Input*

*On entry*: $n$, the order of the matrix $A$.

*Constraint*: **n** $\geq 0$.

4: **a**[$dim$] – Complex *Input/Output*

**Note**: the dimension, *dim*, of the array **a** must be at least $\max(1, \mathbf{pda} \times \mathbf{n})$.

*On entry*: details of the factorization of $A$, as returned by nag_zsytrf (f07nrc).

*On exit*: the factorization is overwritten by the $n$ by $n$ symmetric matrix $A^{-1}$.

If **uplo** = Nag_Upper, the upper triangle of $A^{-1}$ is stored in the upper triangular part of the array.

If **uplo** = Nag_Lower, the lower triangle of $A^{-1}$ is stored in the lower triangular part of the array.

5: **pda** – Integer *Input*

*On entry*: the stride separating row or column elements (depending on the value of **order**) of the matrix in the array **a**.

*Constraint*: **pda** $\geq \max(1, \mathbf{n})$.

6: **ipiv**[$dim$] – const Integer *Input*

**Note**: the dimension, *dim*, of the array **ipiv** must be at least $\max(1, \mathbf{n})$.

*On entry*: details of the interchanges and the block structure of $D$, as returned by nag_zsytrf (f07nrc).

7: **fail** – NagError * *Input/Output*

The NAG error argument (see Section 3.6 in the Essential Introduction).

## 6 Error Indicators and Warnings

**NE_ALLOC_FAIL**

Dynamic memory allocation failed.

**NE_BAD_PARAM**

On entry, argument ⟨*value*⟩ had an illegal value.

**NE_INT**

On entry, **n** = ⟨*value*⟩.
Constraint: **n** $\geq 0$.

On entry, **pda** = ⟨*value*⟩.
Constraint: **pda** $> 0$.

**NE_INT_2**

On entry, **pda** = ⟨*value*⟩ and **n** = ⟨*value*⟩.
Constraint: **pda** $\geq \max(1, \mathbf{n})$.

**NE_INTERNAL_ERROR**

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

**NE_SINGULAR**

$d(\langle value \rangle, \langle value \rangle)$ is exactly zero. $D$ is singular and the inverse of $A$ cannot be computed.

## 7 Accuracy

The computed inverse $X$ satisfies a bound of the form

if **uplo** = Nag_Upper, $|DU^{\mathrm{T}}P^{\mathrm{T}}XPU - I| \leq c(n)\epsilon\big(|D||U^{\mathrm{T}}|P^{\mathrm{T}}|X|P|U| + |D|\big|D^{-1}\big|\big)$;

if **uplo** = Nag_Lower, $|DL^{\mathrm{T}}P^{\mathrm{T}}XPL - I| \leq c(n)\epsilon\big(|D||L^{\mathrm{T}}|P^{\mathrm{T}}|X|P|L| + |D|\big|D^{-1}\big|\big)$,

$c(n)$ is a modest linear function of $n$, and $\epsilon$ is the ***machine precision***.

## 8 Parallelism and Performance

nag_zsytri (f07nwc) is not threaded by NAG in any implementation.

nag_zsytri (f07nwc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the Users' Note for your implementation for any additional implementation-specific information.

## 9 Further Comments

The total number of real floating-point operations is approximately $\frac{8}{3}n^3$.

The real analogue of this function is nag_dsytri (f07mjc).

## 10 Example

This example computes the inverse of the matrix $A$, where

$$A = \begin{pmatrix} -0.39 - 0.71i & 5.14 - 0.64i & -7.86 - 2.96i & 3.80 + 0.92i \\ 5.14 - 0.64i & 8.86 + 1.81i & -3.52 + 0.58i & 5.32 - 1.59i \\ -7.86 - 2.96i & -3.52 + 0.58i & -2.83 - 0.03i & -1.54 - 2.86i \\ 3.80 + 0.92i & 5.32 - 1.59i & -1.54 - 2.86i & -0.56 + 0.12i \end{pmatrix}.$$

Here $A$ is symmetric and must first be factorized by nag_zsytrf (f07nrc).
