nag_zunmqr (f08auc)

1 Purpose

nag_zunmqr (f08auc) multiplies an arbitrary complex matrix C by the complex unitary matrix Q from a QR factorization computed by nag_zgeqrf (f08asc), nag_zgeqpf (f08bsc) or nag_zgeqp3 (f08btc).

2 Specification

```
#include <nag.h>
#include <nagf08.h>

void nag_zunmqr (Nag_OrderType order, Nag_SideType side,
                Nag_TransType trans, Integer m, Integer n, Integer k, const Complex a[],
                Integer pda, const Complex tau[], Complex c[], Integer pdc,
                NagError *fail)
```

3 Description

nag_zunmqr (f08auc) is intended to be used after a call to nag_zgeqrf (f08asc), nag_zgeqpf (f08bsc) or nag_zgeqp3 (f08btc), which perform a QR factorization of a complex matrix A . The unitary matrix Q is represented as a product of elementary reflectors.

This function may be used to form one of the matrix products

$$QC, Q^H C, CQ \text{ or } CQ^H,$$

overwriting the result on c (which may be any complex rectangular matrix).

A common application of this function is in solving linear least squares problems, as described in the f08 Chapter Introduction and illustrated in Section 10 in nag_zgeqrf (f08asc).

Please consult the Users' Note for your implementation for any additional implementation-specific information.
