

NAG Library Function Document

nag_zhbevd (f08hqc)

1 Purpose

`nag_zhbevd` (f08hqc) computes all the eigenvalues and, optionally, all the eigenvectors of a complex Hermitian band matrix. If the eigenvectors are requested, then it uses a divide-and-conquer algorithm to compute eigenvalues and eigenvectors. However, if only eigenvalues are required, then it uses the Pal–Walker–Kahan variant of the QL or QR algorithm.

2 Specification

```
#include <nag.h>
#include <nagf08.h>
void nag_zhbevd (Nag_OrderType order, Nag_JobType job, Nag_UptoType uplo,
                 Integer n, Integer kd, Complex ab[], Integer pdab, double w[],
                 Complex z[], Integer pdz, NagError *fail)
```

3 Description

`nag_zhbevd` (f08hqc) computes all the eigenvalues and, optionally, all the eigenvectors of a complex Hermitian band matrix A . In other words, it can compute the spectral factorization of A as

$$A = Z\Lambda Z^H,$$

where Λ is a real diagonal matrix whose diagonal elements are the eigenvalues λ_i , and Z is the (complex) unitary matrix whose columns are the eigenvectors z_i . Thus

$$Az_i = \lambda_i z_i, \quad i = 1, 2, \dots, n.$$

5 Arguments

1: **order** – Nag_OrderType *Input*

On entry: the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

Constraint: **order** = Nag_RowMajor or Nag_ColMajor.

2: **job** – Nag_JobType *Input*

On entry: indicates whether eigenvectors are computed.

job = Nag_DoNothing

Only eigenvalues are computed.

job = Nag_EigVecs
 Eigenvalues and eigenvectors are computed.

Constraint: **job** = Nag_DoNothing or Nag_EigVecs.

3: **uplo** – Nag_UptoType *Input*

On entry: indicates whether the upper or lower triangular part of A is stored.

uplo = Nag_Upper
 The upper triangular part of A is stored.

uplo = Nag_Lower
 The lower triangular part of A is stored.

Constraint: **uplo** = Nag_Upper or Nag_Lower.

4: **n** – Integer *Input*

On entry: n , the order of the matrix A .

Constraint: **n** ≥ 0 .

5: **kd** – Integer *Input*

On entry: if **uplo** = Nag_Upper, the number of superdiagonals, k_d , of the matrix A .

If **uplo** = Nag_Lower, the number of subdiagonals, k_d , of the matrix A .

Constraint: **kd** ≥ 0 .

6: **ab**[*dim*] – Complex *Input/Output*

Note: the dimension, *dim*, of the array **ab** must be at least $\max(1, \text{pdab} \times \mathbf{n})$.

On entry: the upper or lower triangle of the n by n Hermitian band matrix A .

This is stored as a notional two-dimensional array with row elements or column elements stored contiguously. The storage of elements of A_{ij} , depends on the **order** and **uplo** arguments as follows:

```

if order = 'Nag_ColMajor' and uplo = 'Nag_Upper',
   $A_{ij}$  is stored in ab[ $k_d + i - j + (j - 1) \times \text{pdab}$ ], for  $j = 1, \dots, n$  and
   $i = \max(1, j - k_d), \dots, j$ ;
if order = 'Nag_ColMajor' and uplo = 'Nag_Lower',
   $A_{ij}$  is stored in ab[ $i - j + (j - 1) \times \text{pdab}$ ], for  $j = 1, \dots, n$  and
   $i = j, \dots, \min(n, j + k_d)$ ;
if order = 'Nag_RowMajor' and uplo = 'Nag_Upper',
   $A_{ij}$  is stored in ab[ $j - i + (i - 1) \times \text{pdab}$ ], for  $i = 1, \dots, n$  and
   $j = i, \dots, \min(n, i + k_d)$ ;
if order = 'Nag_RowMajor' and uplo = 'Nag_Lower',
   $A_{ij}$  is stored in ab[ $k_d + j - i + (i - 1) \times \text{pdab}$ ], for  $i = 1, \dots, n$  and
   $j = \max(1, i - k_d), \dots, i$ .

```

On exit: **ab** is overwritten by values generated during the reduction to tridiagonal form.

The first superdiagonal or subdiagonal and the diagonal of the tridiagonal matrix T are returned in **ab** using the same storage format as described above.

7: **pdab** – Integer *Input*

On entry: the stride separating row or column elements (depending on the value of **order**) of the matrix A in the array **ab**.

Constraint: **pdab** $\geq \text{kd} + 1$.

| | | |
|---|--------------------------|---------------------|
| 8: | w [dim] – double | <i>Output</i> |
| Note: the dimension, <i>dim</i> , of the array w must be at least $\max(1, \mathbf{n})$. | | |
| <i>On exit:</i> the eigenvalues of the matrix <i>A</i> in ascending order. | | |
| 9: | z [dim] – Complex | <i>Output</i> |
| Note: the dimension, <i>dim</i> , of the array z must be at least $\max(1, \mathbf{pdz} \times \mathbf{n})$ when job = Nag_EigVecs; 1 when job = Nag_DoNothing. | | |
| The (<i>i</i> , <i>j</i>)th element of the matrix <i>Z</i> is stored in z [(<i>j</i> – 1) × pdz + <i>i</i> – 1] when order = Nag_ColMajor; z [(<i>i</i> – 1) × pdz + <i>j</i> – 1] when order = Nag_RowMajor. | | |
| <i>On exit:</i> if job = Nag_EigVecs, z is overwritten by the unitary matrix <i>Z</i> which contains the eigenvectors of <i>A</i> . The <i>i</i> th column of <i>Z</i> contains the eigenvector which corresponds to the eigenvalue w [<i>i</i> – 1]. | | |
| If job = Nag_DoNothing, z is not referenced. | | |
| 10: | pdz – Integer | <i>Input</i> |
| <i>On entry:</i> the stride separating row or column elements (depending on the value of order) in the array z . | | |
| <i>Constraints:</i> | | |
| if job = Nag_EigVecs, pdz ≥ $\max(1, \mathbf{n})$; if job = Nag_DoNothing, pdz ≥ 1. | | |
| 11: | fail – NagError * | <i>Input/Output</i> |
| The NAG error argument (see Section 3.6 in the Essential Introduction). | | |

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.

NE_BAD_PARAM

On entry, argument $\langle\text{value}\rangle$ had an illegal value.

NE_CONVERGENCE

If **fail.errnum** = $\langle\text{value}\rangle$ and **job** = Nag_DoNothing, the algorithm failed to converge; $\langle\text{value}\rangle$ elements of an intermediate tridiagonal form did not converge to zero; if **fail.errnum** = $\langle\text{value}\rangle$ and **job** = Nag_EigVecs, then the algorithm failed to compute an eigenvalue while working on the submatrix lying in rows and column $\langle\text{value}\rangle/(n + 1)$ through $\langle\text{value}\rangle \bmod (n + 1)$.

NE_ENUM_INT_2

On entry, **job** = $\langle\text{value}\rangle$, **pdz** = $\langle\text{value}\rangle$ and **n** = $\langle\text{value}\rangle$.
Constraint: if **job** = Nag_EigVecs, **pdz** ≥ $\max(1, \mathbf{n})$;
if **job** = Nag_DoNothing, **pdz** ≥ 1.

NE_INT

On entry, **kd** = $\langle\text{value}\rangle$.
Constraint: **kd** ≥ 0.

On entry, **n** = $\langle value \rangle$.

Constraint: **n** ≥ 0 .

On entry, **pdab** = $\langle value \rangle$.

Constraint: **pdab** > 0.

On entry, **pdz** = $\langle value \rangle$.

Constraint: **pdz** > 0.

NE_INT_2

On entry, **pdab** = $\langle value \rangle$ and **kd** = $\langle value \rangle$.

Constraint: **pdab** \geq **kd** + 1.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

7 Accuracy

The computed eigenvalues and eigenvectors are exact for a nearby matrix $(A + E)$, where

$$\|E\|_2 = O(\epsilon)\|A\|_2,$$

and ϵ is the *machine precision*. See Section 4.7 of Anderson *et al.* (1999) for further details.

8 Parallelism and Performance

`nag_zhbevd` (f08hqc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

`nag_zhbevd` (f08hqc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

The real analogue of this function is `nag_dsbevd` (f08hcc).

10 Example

This example computes all the eigenvalues and eigenvectors of the Hermitian band matrix A , where

$$A = \begin{pmatrix} 1 + 0i & 2 - 1i & 3 - 1i & 0 + 0i & 0 + 0i \\ 2 + 1i & 2 + 0i & 3 - 2i & 4 - 2i & 0 + 0i \\ 3 + 1i & 3 + 2i & 3 + 0i & 4 - 3i & 5 - 3i \\ 0 + 0i & 4 + 2i & 4 + 3i & 4 + 0i & 5 - 4i \\ 0 + 0i & 0 + 0i & 5 + 3i & 5 + 4i & 5 + 0i \end{pmatrix}.$$
