NAG Library Function Document

nag_zgesdd (f08krc)

1 Purpose

nag_zgesdd (f08krc) computes the singular value decomposition (SVD) of a complex m by n matrix A, optionally computing the left and/or right singular vectors, by using a divide-and-conquer method.

2 Specification

```
#include <nag.h>
#include <nagf08.h>
void nag_zgesdd (Nag_OrderType order, Nag_JobType job, Integer m, Integer n,
    Complex a[], Integer pda, double s[], Complex u[], Integer pdu,
    Complex vt[], Integer pdvt, NagError *fail)
```

3 Description

The SVD is written as

$$A = U\Sigma V^{\mathrm{H}},$$

where Σ is an m by n matrix which is zero except for its $\min(m,n)$ diagonal elements, U is an m by m unitary matrix, and V is an n by n unitary matrix. The diagonal elements of Σ are the singular values of A; they are real and non-negative, and are returned in descending order. The first $\min(m,n)$ columns of U and V are the left and right singular vectors of A.

Note that the function returns V^{H}, not V.

5 Arguments

1: **order** – Nag_OrderType   *Input*

On entry: the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

Constraint: **order** = Nag_RowMajor or Nag_ColMajor.

2: **job** – Nag_JobType   *Input*

On entry: specifies options for computing all or part of the matrix U.

job = Nag_DoAll
     All m columns of U and all n rows of V^{H} are returned in the arrays **u** and **vt**.

job = Nag_DoSquare

The first $\min(m, n)$ columns of U and the first $\min(m, n)$ rows of V^{H} are returned in the arrays **u** and **vt**.

job = Nag_DoOverwrite

If $\mathbf{m} \geq \mathbf{n}$, the first n columns of U are overwritten on the array **a** and all rows of V^{H} are returned in the array **vt**. Otherwise, all columns of U are returned in the array **u** and the first m rows of V^{H} are overwritten in the array **vt**.

job = Nag_DoNothing

No columns of U or rows of V^{H} are computed.

Constraint: **job** = Nag_DoAll, Nag_DoSquare, Nag_DoOverwrite or Nag_DoNothing.

3:    **m** – Integer   *Input*

On entry: m, the number of rows of the matrix A.

Constraint: $\mathbf{m} \geq 0$.

4:    **n** – Integer   *Input*

On entry: n, the number of columns of the matrix A.

Constraint: $\mathbf{n} \geq 0$.

5:    **a**[*dim*] – Complex   *Input/Output*

Note: the dimension, *dim*, of the array **a** must be at least

$\max(1, \mathbf{pda} \times \mathbf{n})$ when **order** = Nag_ColMajor;
$\max(1, \mathbf{m} \times \mathbf{pda})$ when **order** = Nag_RowMajor.

The (i, j)th element of the matrix A is stored in

$\mathbf{a}[(j-1) \times \mathbf{pda} + i - 1]$ when **order** = Nag_ColMajor;
$\mathbf{a}[(i-1) \times \mathbf{pda} + j - 1]$ when **order** = Nag_RowMajor.

On entry: the m by n matrix A.

On exit: if **job** = Nag_DoOverwrite, **a** is overwritten with the first n columns of U (the left singular vectors, stored column-wise) if $\mathbf{m} \geq \mathbf{n}$; **a** is overwritten with the first m rows of V^{H} (the right singular vectors, stored row-wise) otherwise.

If **job** $\neq$ Nag_DoOverwrite, the contents of **a** are destroyed.

6:    **pda** – Integer   *Input*

On entry: the stride separating row or column elements (depending on the value of **order**) in the array **a**.

Constraints:

if **order** = Nag_ColMajor, $\mathbf{pda} \geq \max(1, \mathbf{m})$;
if **order** = Nag_RowMajor, $\mathbf{pda} \geq \max(1, \mathbf{n})$.

7:    **s**[$\min(\mathbf{m}, \mathbf{n})$] – double   *Output*

On exit: the singular values of A, sorted so that $\mathbf{s}[i-1] \geq \mathbf{s}[i]$.

8:    **u**[*dim*] – Complex   *Output*

Note: the dimension, *dim*, of the array **u** must be at least

$\max(1, \mathbf{pdu} \times \mathbf{m})$ when **job** = Nag_DoAll or **job** = Nag_DoOverwrite and $\mathbf{m} < \mathbf{n}$;
$\max(1, \mathbf{pdu} \times \min(\mathbf{m}, \mathbf{n}))$ when **job** = Nag_DoSquare and **order** = Nag_ColMajor;
$\max(1, \mathbf{m} \times \mathbf{pdu})$ when **job** = Nag_DoSquare and **order** = Nag_RowMajor;
1 otherwise.

The (i, j)th element of the matrix U is stored in

> $\mathbf{u}[(j-1) \times \mathbf{pdu} + i - 1]$ when **order** = Nag_ColMajor;
> $\mathbf{u}[(i-1) \times \mathbf{pdu} + j - 1]$ when **order** = Nag_RowMajor.

On exit:

If **job** = Nag_DoAll or **job** = Nag_DoOverwrite and $\mathbf{m} < \mathbf{n}$, **u** contains the m by m unitary matrix U.

If **job** = Nag_DoSquare, **u** contains the first $\min(m, n)$ columns of U (the left singular vectors, stored column-wise).

If **job** = Nag_DoOverwrite and $\mathbf{m} \geq \mathbf{n}$, or **job** = Nag_DoNothing, **u** is not referenced.

9: **pdu** – Integer *Input*

On entry: the stride separating row or column elements (depending on the value of **order**) in the array **u**.

Constraints:

> if **order** = Nag_ColMajor,
>
>> if **job** = Nag_DoAll or **job** = Nag_DoOverwrite and $\mathbf{m} < \mathbf{n}$, $\mathbf{pdu} \geq \max(1, \mathbf{m})$;
>> if **job** = Nag_DoSquare, $\mathbf{pdu} \geq \max(1, \mathbf{m})$;
>> otherwise $\mathbf{pdu} \geq 1$.;
> if **order** = Nag_RowMajor,
>
>> if **job** = Nag_DoAll or **job** = Nag_DoOverwrite and $\mathbf{m} < \mathbf{n}$, $\mathbf{pdu} \geq \max(1, \mathbf{m})$;
>> if **job** = Nag_DoSquare, $\mathbf{pdu} \geq \max(1, \min(\mathbf{m}, \mathbf{n}))$;
>> otherwise $\mathbf{pdu} \geq 1$..

10: **vt**[dim] – Complex *Output*

Note: the dimension, dim, of the array **vt** must be at least

> $\max(1, \mathbf{pdvt} \times \mathbf{n})$ when **job** = Nag_DoAll or **job** = Nag_DoOverwrite and $\mathbf{m} \geq \mathbf{n}$;
> $\max(1, \mathbf{pdvt} \times \mathbf{n})$ when **job** = Nag_DoSquare and **order** = Nag_ColMajor;
> $\max(1, \min(\mathbf{m}, \mathbf{n}) \times \mathbf{pdvt})$ when **job** = Nag_DoSquare and **order** = Nag_RowMajor;
> 1 otherwise.

The (i, j)th element of the matrix is stored in

> $\mathbf{vt}[(j-1) \times \mathbf{pdvt} + i - 1]$ when **order** = Nag_ColMajor;
> $\mathbf{vt}[(i-1) \times \mathbf{pdvt} + j - 1]$ when **order** = Nag_RowMajor.

On exit: if **job** = Nag_DoAll or **job** = Nag_DoOverwrite and $\mathbf{m} \geq \mathbf{n}$, **vt** contains the n by n unitary matrix V^{H}.

If **job** = Nag_DoSquare, **vt** contains the first $\min(m, n)$ rows of V^{H} (the right singular vectors, stored row-wise).

If **job** = Nag_DoOverwrite and $\mathbf{m} < \mathbf{n}$, or **job** = Nag_DoNothing, **vt** is not referenced.

11: **pdvt** – Integer *Input*

On entry: the stride separating row or column elements (depending on the value of **order**) in the array **vt**.

Constraints:

> if **order** = Nag_ColMajor,
>
>> if **job** = Nag_DoAll or **job** = Nag_DoOverwrite and $\mathbf{m} \geq \mathbf{n}$, $\mathbf{pdvt} \geq \max(1, \mathbf{n})$;
>> if **job** = Nag_DoSquare, $\mathbf{pdvt} \geq \max(1, \min(\mathbf{m}, \mathbf{n}))$;
>> otherwise $\mathbf{pdvt} \geq 1$.;

if **order** = Nag_RowMajor,

if **job** = Nag_DoAll or **job** = Nag_DoOverwrite and $\mathbf{m} \geq \mathbf{n}$, **pdvt** $\geq \max(1, \mathbf{n})$;
if **job** = Nag_DoSquare, **pdvt** $\geq \max(1, \mathbf{n})$;
otherwise **pdvt** ≥ 1..

12: **fail** – NagError *   *Input/Output*

The NAG error argument (see Section 3.6 in the Essential Introduction).

6   Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.

NE_BAD_PARAM

On entry, argument ⟨*value*⟩ had an illegal value.

NE_CONVERGENCE

nag_zgesdd (f08krc) did not converge, the updating process failed.

NE_ENUM_INT_3

On entry, **job** = ⟨*value*⟩, **pdu** = ⟨*value*⟩, $\mathbf{m}$ = ⟨*value*⟩ and $\mathbf{n}$ = ⟨*value*⟩.
Constraint: if **job** = Nag_DoAll or **job** = Nag_DoOverwrite and $\mathbf{m} < \mathbf{n}$, **pdu** $\geq \max(1, \mathbf{m})$;
if **job** = Nag_DoSquare, **pdu** $\geq \max(1, \mathbf{m})$;
otherwise **pdu** ≥ 1.

On entry, **job** = ⟨*value*⟩, **pdu** = ⟨*value*⟩, $\mathbf{m}$ = ⟨*value*⟩ and $\mathbf{n}$ = ⟨*value*⟩.
Constraint: if **job** = Nag_DoAll or **job** = Nag_DoOverwrite and $\mathbf{m} < \mathbf{n}$, **pdu** $\geq \max(1, \mathbf{m})$;
if **job** = Nag_DoSquare, **pdu** $\geq \max(1, \min(\mathbf{m}, \mathbf{n}))$;
otherwise **pdu** ≥ 1.

On entry, **job** = ⟨*value*⟩, **pdvt** = ⟨*value*⟩, $\mathbf{m}$ = ⟨*value*⟩ and $\mathbf{n}$ = ⟨*value*⟩.
Constraint: if **job** = Nag_DoAll or **job** = Nag_DoOverwrite and $\mathbf{m} \geq \mathbf{n}$, **pdvt** $\geq \max(1, \mathbf{n})$;
if **job** = Nag_DoSquare, **pdvt** $\geq \max(1, \min(\mathbf{m}, \mathbf{n}))$;
otherwise **pdvt** ≥ 1.

On entry, **job** = ⟨*value*⟩, **pdvt** = ⟨*value*⟩, $\mathbf{m}$ = ⟨*value*⟩ and $\mathbf{n}$ = ⟨*value*⟩.
Constraint: if **job** = Nag_DoAll or **job** = Nag_DoOverwrite and $\mathbf{m} \geq \mathbf{n}$, **pdvt** $\geq \max(1, \mathbf{n})$;
if **job** = Nag_DoSquare, **pdvt** $\geq \max(1, \mathbf{n})$;
otherwise **pdvt** ≥ 1.

NE_INT

On entry, $\mathbf{m}$ = ⟨*value*⟩.
Constraint: $\mathbf{m} \geq 0$.

On entry, $\mathbf{n}$ = ⟨*value*⟩.
Constraint: $\mathbf{n} \geq 0$.

On entry, **pda** = ⟨*value*⟩.
Constraint: **pda** > 0.

On entry, **pdu** = ⟨*value*⟩.
Constraint: **pdu** > 0.

On entry, **pdvt** = ⟨*value*⟩.
Constraint: **pdvt** > 0.

NE_INT_2

On entry, **pda** = $\langle value \rangle$ and **m** = $\langle value \rangle$.
Constraint: **pda** $\geq \max(1, \mathbf{m})$.

On entry, **pda** = $\langle value \rangle$ and **n** = $\langle value \rangle$.
Constraint: **pda** $\geq \max(1, \mathbf{n})$.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

7 Accuracy

The computed singular value decomposition is nearly the exact singular value decomposition for a nearby matrix $(A + E)$, where

$$\|E\|_2 = O(\epsilon)\|A\|_2,$$

and ϵ is the **machine precision**. In addition, the computed singular vectors are nearly orthogonal to working precision. See Section 4.9 of Anderson *et al.* (1999) for further details.

8 Parallelism and Performance

nag_zgesdd (f08krc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

nag_zgesdd (f08krc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

The total number of floating-point operations is approximately proportional to mn^2 when $m > n$ and m^2n otherwise.

The singular values are returned in descending order.

The real analogue of this function is nag_dgesdd (f08kdc).

10 Example

This example finds the singular values and left and right singular vectors of the 4 by 6 matrix

$$A = \begin{pmatrix} 0.96 + 0.81i & -0.98 - 1.98i & 0.62 + 0.46i & -0.37 - 0.38i & 0.83 - 0.51i & 1.08 + 0.28i \\ -0.03 - 0.96i & -1.20 - 0.19i & 1.01 - 0.02i & 0.19 + 0.54i & 0.20 - 0.01i & 0.20 + 0.12i \\ -0.91 - 2.06i & -0.66 - 0.42i & 0.63 + 0.17i & -0.98 + 0.36i & -0.17 + 0.46i & -0.07 - 1.23i \\ -0.05 - 0.41i & -0.81 - 0.56i & -1.11 - 0.60i & 0.22 + 0.20i & 1.47 - 1.59i & 0.26 - 0.26i \end{pmatrix},$$

together with approximate error bounds for the computed singular values and vectors.

The example program for nag_zgesvd (f08kpc) illustrates finding a singular value decomposition for the case $m \geq n$.
