

NAG Library Function Document

nag_zsymv (f16tac)

1 Purpose

nag_zsymv (f16tac) performs matrix-vector multiplication for a complex symmetric matrix.

2 Specification

```
#include <nag.h>
#include <nagf16.h>
void nag_zsymv (Nag_OrderType order, Nag_UptoType uplo, Integer n,
                Complex alpha, const Complex a[], Integer pda, const Complex x[],
                Integer incx, Complex beta, Complex y[], Integer incy, NagError *fail)
```

3 Description

nag_zsymv (f16tac) performs the matrix-vector operation

$$y \leftarrow \alpha Ax + \beta y$$

where A is an n by n complex symmetric matrix, x and y are n -element complex vectors, and α and β are complex scalars.

5 Arguments

1: **order** – Nag_OrderType *Input*

On entry: the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

Constraint: **order** = Nag_RowMajor or Nag_ColMajor.

2: **uplo** – Nag_UptoType *Input*

On entry: specifies whether the upper or lower triangular part of A is stored.

uplo = Nag_Upper

The upper triangular part of A is stored.

uplo = Nag_Lower

The lower triangular part of A is stored.

Constraint: **uplo** = Nag_Upper or Nag_Lower.

3: **n** – Integer *Input*

On entry: n , the order of the matrix A .

Constraint: **n** ≥ 0 .

4:	alpha – Complex	<i>Input</i>
<i>On entry:</i> the scalar α .		
5:	a [<i>dim</i>] – const Complex	<i>Input</i>
Note: the dimension, <i>dim</i> , of the array a must be at least $\max(1, \mathbf{pda} \times \mathbf{n})$.		
<i>On entry:</i> the <i>n</i> by <i>n</i> symmetric matrix <i>A</i> .		
If order = 'Nag_ColMajor', A_{ij} is stored in a [(<i>j</i> − 1) × pda + <i>i</i> − 1].		
If order = 'Nag_RowMajor', A_{ij} is stored in a [(<i>i</i> − 1) × pda + <i>j</i> − 1].		
If uplo = 'Nag_Upper', the upper triangular part of <i>A</i> must be stored and the elements of the array below the diagonal are not referenced.		
If uplo = 'Nag_Lower', the lower triangular part of <i>A</i> must be stored and the elements of the array above the diagonal are not referenced.		
6:	pda – Integer	<i>Input</i>
<i>On entry:</i> the stride separating row or column elements (depending on the value of order) of the matrix <i>A</i> in the array a .		
<i>Constraint:</i> pda ≥ $\max(1, \mathbf{n})$.		
7:	x [<i>dim</i>] – const Complex	<i>Input</i>
Note: the dimension, <i>dim</i> , of the array x must be at least $\max(1, 1 + (\mathbf{n} - 1) \mathbf{incx})$.		
<i>On entry:</i> the vector <i>x</i> .		
8:	incx – Integer	<i>Input</i>
<i>On entry:</i> the increment in the subscripts of x between successive elements of <i>x</i> .		
<i>Constraint:</i> incx ≠ 0.		
9:	beta – Complex	<i>Input</i>
<i>On entry:</i> the scalar β .		
10:	y [<i>dim</i>] – Complex	<i>Input/Output</i>
Note: the dimension, <i>dim</i> , of the array y must be at least $\max(1, 1 + (\mathbf{n} - 1) \mathbf{incy})$.		
<i>On entry:</i> the vector <i>y</i> .		
If beta = 0, y need not be set.		
<i>On exit:</i> the updated vector <i>y</i> .		
11:	incy – Integer	<i>Input</i>
<i>On entry:</i> the increment in the subscripts of y between successive elements of <i>y</i> .		
<i>Constraint:</i> incy ≠ 0.		
12:	fail – NagError *	<i>Input/Output</i>
The NAG error argument (see Section 3.6 in the Essential Introduction).		

6 Error Indicators and Warnings

NE_BAD_PARAM

On entry, argument $\langle value \rangle$ had an illegal value.

NE_INT

On entry, **incx** = $\langle value \rangle$.

Constraint: **incx** $\neq 0$.

On entry, **incy** = $\langle value \rangle$.

Constraint: **incy** $\neq 0$.

On entry, **n** = $\langle value \rangle$.

Constraint: **n** ≥ 0 .

NE_INT_2

On entry, **pda** = $\langle value \rangle$, **n** = $\langle value \rangle$.

Constraint: **pda** $\geq \max(1, \mathbf{n})$.

7 Accuracy

The BLAS standard requires accurate implementations which avoid unnecessary over/underflow (see Section 2.7 of Basic Linear Algebra Subprograms Technical (BLAST) Forum (2001)).

8 Parallelism and Performance

Not applicable.

9 Further Comments

None.

10 Example

This example computes the matrix-vector product

$$y = \alpha Ax + \beta y$$

where

$$A = \begin{pmatrix} 1.0 + 1.0i & 1.0 + 2.0i & 1.0 + 3.0i \\ 1.0 + 2.0i & 2.0 + 2.0i & 2.0 + 3.0i \\ 1.0 + 3.0i & 2.0 + 3.0i & 3.0 + 3.0i \end{pmatrix},$$

$$x = \begin{pmatrix} -1.0 + 0.0i \\ 0.0 + 2.0i \\ -3.0 + 1.0i \end{pmatrix},$$

$$y = \begin{pmatrix} 6.0 + 4.5i \\ 8.5 + 4.5i \\ 12.0 + 5.5i \end{pmatrix},$$

$$\alpha = 1.0 + 0.0i \quad \text{and} \quad \beta = 2.0 + 0.0i.$$
