

## NAG Library Function Document

### nag\_binomial\_dist (g01bjc)

## 1 Purpose

nag\_binomial\_dist (g01bjc) returns the lower tail, upper tail and point probabilities associated with a binomial distribution.

## 2 Specification

```
#include <nag.h>
#include <nagg01.h>
void nag_binomial_dist (Integer n, double p, Integer k, double *plek,
                        double *pgtk, double *peqk, NagError *fail)
```

## 3 Description

Let  $X$  denote a random variable having a binomial distribution with parameters  $n$  and  $p$  ( $n \geq 0$  and  $0 < p < 1$ ). Then

$$\text{Prob}\{X = k\} = \binom{n}{k} p^k (1-p)^{n-k}, \quad k = 0, 1, \dots, n.$$

The mean of the distribution is  $np$  and the variance is  $np(1-p)$ .

nag\_binomial\_dist (g01bjc) computes for given  $n$ ,  $p$  and  $k$  the probabilities:

$$\begin{aligned} \mathbf{plek} &= \text{Prob}\{X \leq k\} \\ \mathbf{pgtk} &= \text{Prob}\{X > k\} \\ \mathbf{peqk} &= \text{Prob}\{X = k\}. \end{aligned}$$

The method is similar to the method for the Poisson distribution described in Knüsel (1986).

## 5 Arguments

- |  |              |
|--|--------------|
| 1: <b>n</b> – Integer  | <i>Input</i> |
| <i>On entry:</i> the parameter $n$ of the binomial distribution.           |              |
| <i>Constraint:</i> $n \geq 0$ .  |              |
| 2: <b>p</b> – double   | <i>Input</i> |
| <i>On entry:</i> the parameter $p$ of the binomial distribution.           |              |
| <i>Constraint:</i> $0.0 < p < 1.0$ .                                       |              |
| 3: <b>k</b> – Integer  | <i>Input</i> |
| <i>On entry:</i> the integer $k$ which defines the required probabilities. |              |
| <i>Constraint:</i> $0 \leq k \leq n$ .                                     |              |

4:	<b>plek</b> – double *	<i>Output</i>
<i>On exit:</i> the lower tail probability, $\text{Prob}\{X \leq k\}$ .		
5:	<b>pgtk</b> – double *	<i>Output</i>
<i>On exit:</i> the upper tail probability, $\text{Prob}\{X > k\}$ .		
6:	<b>peqk</b> – double *	<i>Output</i>
<i>On exit:</i> the point probability, $\text{Prob}\{X = k\}$ .		
7:	<b>fail</b> – NagError *	<i>Input/Output</i>
The NAG error argument (see Section 3.6 in the Essential Introduction).		

## 6 Error Indicators and Warnings

### NE\_2\_INT\_ARG\_GT

On entry,  $k = \langle \text{value} \rangle$  and  $n = \langle \text{value} \rangle$ .  
 Constraint:  $k \leq$  or  $n$ .

### NE\_ARG\_TOO\_LARGE

On entry,  $n$  is too large to be represented exactly as a double precision number.

### NE\_BAD\_PARAM

On entry, argument  $\langle \text{value} \rangle$  had an illegal value.

### NE\_INT\_ARG\_LT

On entry,  $k = \langle \text{value} \rangle$ .  
 Constraint:  $k \geq 0$ .  
 On entry,  $n = \langle \text{value} \rangle$ .  
 Constraint:  $n \geq 0$ .

### NE\_INTERNAL\_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

### NE\_REAL\_ARG\_GE

On entry,  $p = \langle \text{value} \rangle$ .  
 Constraint:  $p < 1.0$ .

### NE\_REAL\_ARG\_LE

On entry,  $p = \langle \text{value} \rangle$ .  
 Constraint:  $p > 0.0$ .

### NE\_VARIANCE\_TOO\_LARGE

On entry, the variance ( $= np(1 - p)$ ) exceeds  $10^6$ .

## 7 Accuracy

Results are correct to a relative accuracy of at least  $10^{-6}$  on machines with a precision of 9 or more decimal digits, and to a relative accuracy of at least  $10^{-3}$  on machines of lower precision (provided that the results do not underflow to zero).

## 8 Parallelism and Performance

Not applicable.

## 9 Further Comments

The time taken by nag\_binomial\_dist (g01bjc) depends on the variance ( $= np(1 - p)$ ) and on  $k$ . For given variance, the time is greatest when  $k \approx np$  (= the mean), and is then approximately proportional to the square-root of the variance.

## 10 Example

This example reads values of  $n$  and  $p$  from a data file until end-of-file is reached, and prints the corresponding probabilities.
