nag_mills_ratio (g01mbc)

1 Purpose

nag_mills_ratio (g01mbc) returns the reciprocal of Mills' Ratio.

2 Specification

```
#include <nag.h>
#include <nagg01.h>
double nag_mills_ratio (double x)
```

3 Description

nag_mills_ratio (g01mbc) calculates the reciprocal of Mills' Ratio, the hazard rate, $\lambda(x)$, for the standard Normal distribution. It is defined as the ratio of the ordinate to the upper tail area of the standard Normal distribution, that is,

$$\lambda(x) = \frac{Z(x)}{Q(x)} = \frac{\frac{1}{\sqrt{2\pi}}e^{-(x^2/2)}}{\frac{1}{\sqrt{2\pi}} \int_x^\infty e^{-(t^2/2)} dt}.$$

The calculation is based on a Chebyshev expansion as described in nag_erfcx (s15agc).

4 References

5 Arguments

1:	x – double	<i>Input</i>
----	-------------------	--------------

On entry: x , the argument of the reciprocal of Mills' Ratio.

6 Error Indicators and Warnings

None.

7 Accuracy

In the left-hand tail, $x < 0.0$, if $\frac{1}{2}e^{-(1/2)x^2} \leq$ the safe range argument (nag_real_safe_small_number (X02AMC)), then 0.0 is returned, which is close to the true value.

The relative accuracy is bounded by the effective **machine precision**. See nag_erfcx (s15agc) for further discussion.

8 Parallelism and Performance

Not applicable.

9 Further Comments

If, before entry, x is not a standard Normal variable, it has to be standardized, and on exit, nag_mills_ratio (g01mbc) has to be divided by the standard deviation. That is, if the Normal distribution has mean μ and variance σ^2 , then its hazard rate, $\lambda(x; \mu, \sigma^2)$, is given by

$$\lambda(x; \mu, \sigma^2) = \lambda((x - \mu)/\sigma)/\sigma.$$

10 Example

The hazard rate is evaluated at different values of x for Normal distributions with different means and variances. The results are then printed.

10.1 Program Text

```
/* nag_mills_ratio (g01mbc) Example Program.
*
* Copyright 2001 Numerical Algorithms Group.
*
* Mark 7, 2001.
*/
#include <stdio.h>
#include <nag.h>
#include <nag_stdlib.h>
#include <nagg01.h>

int main(void)
{
    /* Scalars */
    Integer exit_status = 0;
    double rm, x, xm, xsig, z;
    Integer i;

    printf("nag_mills_ratio (g01mbc) Example Program Results\n");

    /* Skip heading in data file */
    scanf("%*[^\n] ");

    printf("\n%2sMean%5sSigma%4sX%8sReciprocal", "", "", "", "");
    printf("                                     Mills Ratio\n\n");
    for (i = 1; i <= 3; ++i)
    {
        scanf("%lf%lf%lf%*[^\n] ", &x, &xm, &xsig);
        z = (x - xm) / xsig;
        /* nag_mills_ratio (g01mbc).
         * Computes reciprocal of Mills' Ratio
         */
        rm = nag_mills_ratio(z) / xsig;
        printf("%7.4f%2s%7.4f%2s%7.4f%2s%7.4f", xm, "", xsig, "", x, "",
               rm);
        printf("\n");
    }

    return exit_status;
}
```

10.2 Program Data

```
nag_mills_ratio (g01mbc) Example Program Data
0.0 0.0 1.0
-2.0 1.0 2.5
10.3 9.0 1.6
```

10.3 Program Results

nag_mills_ratio (g01mbc) Example Program Results

Mean	Sigma	X	Reciprocal Mills Ratio
0.0000	1.0000	0.0000	0.7979
1.0000	2.5000	-2.0000	0.0878
9.0000	1.6000	10.3000	0.8607
