

## NAG Library Function Document

### nag\_rand\_skip\_ahead\_power2 (g05kkc)

#### 1 Purpose

nag\_rand\_skip\_ahead\_power2 (g05kkc) allows for the generation of multiple, independent, sequences of pseudorandom numbers using the skip-ahead method. The base pseudorandom number sequence defined by **state** is advanced  $2^n$  places.

#### 2 Specification

```
#include <nag.h>
#include <nagg05.h>
void nag_rand_skip_ahead_power2 (Integer n, Integer state[], NagError *fail)
```

#### 3 Description

nag\_rand\_skip\_ahead\_power2 (g05kkc) adjusts a base generator to allow multiple, independent, sequences of pseudorandom numbers to be generated via the skip-ahead method (see the g05 Chapter Introduction for details).

If, prior to calling nag\_rand\_skip\_ahead\_power2 (g05kkc) the base generator defined by **state** would produce random numbers  $x_1, x_2, x_3, \dots$ , then after calling nag\_rand\_skip\_ahead\_power2 (g05kkc) the generator will produce random numbers  $x_{2^n+1}, x_{2^n+2}, x_{2^n+3}, \dots$

One of the initialization functions nag\_rand\_init\_repeatable (g05kfc) (for a repeatable sequence if computed sequentially) or nag\_rand\_init\_nonrepeatable (g05kge) (for a non-repeatable sequence) must be called prior to the first call to nag\_rand\_skip\_ahead\_power2 (g05kkc).

The skip-ahead algorithm can be used in conjunction with any of the six base generators discussed in the g05 Chapter Introduction.

#### 5 Arguments

1: **n** – Integer *Input*

*On entry:*  $n$ , where the number of places to skip-ahead is defined as  $2^n$ .

*Constraint:*  $n \geq 0$ .

2: **state**[*dim*] – Integer *Communication Array*

**Note:** the dimension, *dim*, of this array is dictated by the requirements of associated functions that must have been previously called. This array **MUST** be the same array passed as argument **state** in the previous call to nag\_rand\_init\_repeatable (g05kfc) or nag\_rand\_init\_nonrepeatable (g05kge).

*On entry:* contains information on the selected base generator and its current state.

*On exit:* contains updated information on the state of the generator.

3: **fail** – NagError \*

*Input/Output*

The NAG error argument (see Section 3.6 in the Essential Introduction).

## 6 Error Indicators and Warnings

### NE\_ALLOC\_FAIL

Dynamic memory allocation failed.

### NE\_ARRAY\_SIZE

On entry, the **state** vector defined on initialization is not large enough to perform a skip-ahead (applies to Mersenne Twister base generator). See the initialization function `nag_rand_init_repeatable` (g05kfc) or `nag_rand_init_nonrepeatable` (g05kgc).

### NE\_BAD\_PARAM

On entry, argument  $\langle value \rangle$  had an illegal value.

### NE\_INT

On entry,  $n = \langle value \rangle$ .  
Constraint:  $n \geq 0$ .

### NE\_INT\_ARRAY

On entry, cannot use skip-ahead with the base generator defined by **state**.

### NE\_INTERNAL\_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

### NE\_INVALID\_STATE

On entry, **state** vector has been corrupted or not initialized.

## 7 Accuracy

Not applicable.

## 8 Parallelism and Performance

Not applicable.

## 9 Further Comments

Calling `nag_rand_skip Ahead_power2` (g05kkc) and then generating a series of uniform values using `nag_rand_basic` (g05sac) is equivalent to, but more efficient than, calling `nag_rand_basic` (g05sac) and discarding the first  $2^n$  values. This may not be the case for distributions other than the uniform, as some distributional generators require more than one uniform variate to generate a single draw from the required distribution.

## 10 Example

This example initializes a base generator using `nag_rand_init_repeatable` (g05kfc) and then uses `nag_rand_skip Ahead_power2` (g05kkc) to advance the sequence  $2^{17}$  places before generating five variates from a uniform distribution using `nag_rand_basic` (g05sac).
