NAG Library Function Document

nag median test (g08acc)

1 Purpose

nag_median_test (g08acc) performs the Median test on two independent samples of possibly unequal size.

2 Specification

3 Description

The Median test investigates the difference between the medians of two independent samples of sizes n_1 and n_2 , denoted by:

$$x_1, x_2, \dots, x_{n_1}$$
 and $x_{n_1+1}, x_{n_1+2}, \dots, x_n, n = n_1 + n_2$.

The hypothesis under test, H_0 , often called the null hypothesis, is that the medians are the same, and this is to be tested against the alternative hypothesis H_1 that they are different.

The test proceeds by forming a 2×2 frequency table, giving the number of scores in each sample above and below the median of the pooled sample:

Under the null hypothesis, H_0 , we would expect about half of each group's scores to be above the pooled median and about half below, that is, we would expect i_1 to be about $n_1/2$ and i_2 to be about $n_2/2$.

nag_median_test (g08acc) returns:

- (a) the frequencies i_1 and i_2 ;
- (b) the probability, p, of observing a table at least as 'extreme' as that actually observed, given that H_0 is true. If n < 40, p is computed directly ('Fisher's exact test'); otherwise a χ_1^2 approximation is used.

 H_0 is rejected by a test of chosen size α if $p < \alpha$.

5 Arguments

1: **n1** – Integer Input

On entry: the size of the first sample, n_1 .

Constraint: $\mathbf{n1} \geq 1$.

2: $\mathbf{x}[\mathbf{n}\mathbf{1}]$ – const double

Input

On entry: the elements of \mathbf{x} must be set to the data values in the first sample.

3: **n2** – Integer Input

On entry: the size of the second sample, n_2 .

Constraint: $n2 \ge 1$.

4: y[n2] – const double

Input

On entry: the elements of y must be set to the data values in the second sample.

5: **below** – Integer *

Output

On exit: the number of scores in the first sample which lie below the pooled median, i_1 .

6: **above** – Integer *

Output

On exit: the number of scores in the first sample which lie above the pooled median, i_2 .

7: **p** – double *

Output

On exit: the tail probability, p, corresponding to the observed dichotomy of the two samples.

8: **fail** – NagError *

Input/Output

The NAG error argument (see Section 3.6 in the Essential Introduction).

6 Error Indicators and Warnings

NE ALLOC FAIL

Dynamic memory allocation failed.

NE_INT_ARG_LT

On entry, **n1** must not be less than 1: $\mathbf{n1} = \langle value \rangle$.

On entry, **n2** must not be less than 1: $\mathbf{n2} = \langle value \rangle$.

7 Accuracy

The probability returned should be accurate enough for practical use.

8 Parallelism and Performance

Not applicable.

9 Further Comments

The time taken by nag median test (g08acc) is small, and increases with n.

g08acc.2 Mark 24

10 Example

This example is taken from page 112 of Siegel (1956). The data relate to scores of 'oral socialisation anxiety' in 39 societies, which can be separated into groups of size 16 and 23 on the basis of their attitudes to illness.
