# **NAG Library Function Document**

## nag surviv risk sets (g12zac)

## 1 Purpose

nag\_surviv\_risk\_sets (g12zac) creates the risk sets associated with the Cox proportional hazards model for fixed covariates.

## 2 Specification

## 3 Description

The Cox proportional hazards model (see Cox (1972)) relates the time to an event, usually death or failure, to a number of explanatory variables known as covariates. Some of the observations may be right-censored, that is, the exact time to failure is not known, only that it is greater than a known time.

Let  $t_i$ , for i = 1, 2, ..., n, be the failure time or censored time for the *i*th observation with the vector of p covariates  $z_i$ . The covariance matrix Z is constructed so that it contains n rows with the *i*th row containing the p covariates  $z_i$ . It is assumed that censoring and failure mechanisms are independent. The hazard function,  $\lambda(t, z)$ , is the probability that an individual with covariates z fails at time t given that the individual survived up to time t. In the Cox proportional hazards model,  $\lambda(t, z)$  is of the form

$$\lambda(t,z) = \lambda_0(t) \exp(z^{\mathrm{T}}\beta),$$

where  $\lambda_0$  is the base-line hazard function, an unspecified function of time, and  $\beta$  is a vector of unknown arguments. As  $\lambda_0$  is unknown, the arguments  $\beta$  are estimated using the conditional or marginal likelihood. This involves considering the covariate values of all subjects that are at risk at the time when a failure occurs. The probability that the subject that failed had their observed set of covariate values is computed.

The risk set at a failure time consists of those subjects that fail or are censored at that time and those who survive beyond that time. As risk sets are computed for every distinct failure time, it should be noted that the combined risk sets may be considerably larger than the original data. If the data can be considered as coming from different strata such that  $\lambda_0$  varies from strata to strata but  $\beta$  remains constant, then nag\_surviv\_risk\_sets (g12zac) will return a factor that indicates to which risk set/strata each member of the risk sets belongs rather than just to which risk set.

Given the risk sets the Cox proportional hazards model can then be fitted using a Poisson generalized linear model (nag\_glm\_poisson (g02gcc) with nag\_dummy\_vars (g04eac) to compute dummy variables) using Breslow's approximation for ties (see Breslow (1974)). This will give the same fit as nag\_surviv\_cox\_model (g12bac). If the exact treatment of ties in discrete time is required, as given by Cox (1972), then the model is fitted as a conditional logistic model using nag\_condl\_logistic (g11cac).

## 5 Arguments

1: **order** – Nag OrderType

Input

On entry: the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag\_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

Constraint: order = Nag\_RowMajor or Nag\_ColMajor.

2:  $\mathbf{n}$  - Integer Input

On entry: n, the number of data points.

Constraint:  $n \geq 2$ .

3:  $\mathbf{m}$  - Integer Input

On entry: the number of covariates in array z.

Constraint:  $\mathbf{m} \geq 1$ .

4: **ns** – Integer Input

On entry: the number of strata. If  $\mathbf{ns} > 0$  then the stratum for each observation must be supplied in isi

Constraint:  $\mathbf{ns} \geq 0$ .

5:  $\mathbf{z}[dim]$  – const double

Input

**Note**: the dimension, dim, of the array z must be at least

```
max(1, pdz \times m) when order = Nag\_ColMajor; max(1, n \times pdz) when order = Nag\_RowMajor.
```

The (i, j)th element of the matrix Z is stored in

```
\mathbf{z}[(j-1) \times \mathbf{pdz} + i - 1] when \mathbf{order} = \text{Nag\_ColMajor}; \mathbf{z}[(i-1) \times \mathbf{pdz} + j - 1] when \mathbf{order} = \text{Nag\_RowMajor}.
```

On entry: must contain the n covariates in column or row major order.

6: **pdz** – Integer Input

On entry: the stride separating row or column elements (depending on the value of **order**) in the array z.

Constraints:

```
if order = Nag_ColMajor, pdz \ge n; if order = Nag_RowMajor, pdz \ge m.
```

g12zac.2 Mark 24

7: **isz**[**m**] – const Integer

Input

On entry: indicates which subset of covariates are to be included in the model.

isz[j - 1] ≥ 1

The jth covariate is included in the model.

 $\mathbf{isz}[j-1] = 0$ 

The jth covariate is excluded from the model and not referenced.

Constraint:  $\mathbf{isz}[j-1] \geq 0$  and at least one value must be nonzero.

8: **ip** – Integer

Input

On entry: p, the number of covariates included in the model as indicated by isz.

Constraint: ip = the number of nonzero values of isz.

9:  $\mathbf{t}[\mathbf{n}]$  – const double

Input

On entry: the vector of n failure censoring times.

10: ic[n] - const Integer

Input

On entry: the status of the individual at time t given in t.

 $\mathbf{ic}[i-1] = 0$ 

Indicates that the *i*th individual has failed at time t[i-1].

 $\mathbf{ic}[i-1] = 1$ 

Indicates that the *i*th individual has been censored at time t[i-1].

Constraint: ic[i-1] = 0 or 1, for i = 1, 2, ..., n.

11: isi[dim] – const Integer

Input

Note: the dimension, dim, of the array isi must be at least

**n** when  $\mathbf{ns} > 0$ ;

1 otherwise.

On entry: if  $\mathbf{ns} > 0$ , the stratum indicators which also allow data points to be excluded from the analysis.

If  $\mathbf{ns} = 0$ , **isi** is not referenced.

isi[i] = k

Indicates that the *i*th data point is in the *k*th stratum, where k = 1, 2, ..., ns.

 $\mathbf{isi}[i] = 0$ 

Indicates that the ith data point is omitted from the analysis.

Constraint: if  $\mathbf{ns} > 0$ ,  $0 \le \mathbf{isi}[i] \le \mathbf{ns}$ , for  $i = 0, 1, \dots, \mathbf{n} - 1$ .

12: **num** – Integer \*

Output

On exit: the number of values in the combined risk sets.

13: ixs[mxn] – Integer

Output

On exit: the factor giving the risk sets/strata for the data in  $\mathbf{x}$  and  $\mathbf{id}$ .

If  $\mathbf{ns} = 0$  or 1,  $\mathbf{ixs}[i-1] = l$  for members of the *l*th risk set.

If  $\mathbf{ns} > 1$ ,  $\mathbf{ixs}[i-1] = (j-1) \times \mathbf{nd} + l$  for the observations in the *l*th risk set for the *j*th strata.

14: **nxs** – Integer \*

Output

On exit: the number of levels for the risk sets/strata factor given in ixs.

g12zac NAG Library Manual

15:  $\mathbf{x}[\mathbf{m}\mathbf{x}\mathbf{n} \times \mathbf{i}\mathbf{p}] - \text{double}$ 

Output

Note: the (i, j)th element of the matrix X is stored in

$$\mathbf{x}[(j-1) \times \mathbf{m}\mathbf{x}\mathbf{n} + i - 1]$$
 when **order** = Nag\_ColMajor;  $\mathbf{x}[(i-1) \times \mathbf{i}\mathbf{p} + j - 1]$  when **order** = Nag\_RowMajor.

On exit: the first **num** rows contain the values of the covariates for the members of the risk sets.

16: **mxn** – Integer

Input

On entry: the first dimension of the array x and the dimension of the arrays ixs and id.

Constraint:  $\mathbf{mxn}$  must be sufficiently large for the arrays to contain the expanded risk sets. The size will depend on the pattern of failures times and censored times. The minimum value will be returned in  $\mathbf{num}$  unless the function exits with  $\mathbf{fail.code} = \mathrm{NE}$  INT.

17: id[mxn] – Integer

Output

On exit: indicates if the member of the risk set given in  $\mathbf{x}$  failed.

id[i-1] = 1 if the member of the risk set failed at the time defining the risk set and id[i-1] = 0 otherwise.

18: **nd** – Integer \*

Output

On exit: the number of distinct failure times, i.e., the number of risk sets.

19: tp[n] – double

Output

On exit: tp[i-1] contains the *i*th distinct failure time, for  $i=1,2,\ldots,nd$ .

20: irs[n] - Integer

Output

On exit: indicates rows in **x** and elements in **ixs** and **id** corresponding to the risk sets. The first risk set corresponding to failure time  $\mathbf{tp}[0]$  is given by rows 1 to  $\mathbf{irs}[0]$ . The lth risk set is given by rows  $\mathbf{id}[l-2]+1$  to  $\mathbf{id}[l-1]$ , for  $l=1,2,\ldots,\mathbf{nd}$ .

21: **fail** – NagError \*

Input/Output

The NAG error argument (see Section 3.6 in the Essential Introduction).

## 6 Error Indicators and Warnings

#### NE\_ALLOC\_FAIL

Dynamic memory allocation failed.

### NE BAD PARAM

On entry, argument  $\langle value \rangle$  had an illegal value.

#### NE INT

On entry, element  $\langle value \rangle$  of **ic** is not equal to 0 or 1.

On entry, element  $\langle value \rangle$  of **isi** is not valid.

On entry, element  $\langle value \rangle$  of **isz** < 0.

On entry,  $\mathbf{m} = \langle value \rangle$ .

Constraint:  $\mathbf{m} \geq 1$ .

On entry,  $\mathbf{n} = \langle value \rangle$ .

Constraint:  $\mathbf{n} \geq 2$ .

g12zac.4 Mark 24

```
On entry, \mathbf{ns} = \langle value \rangle.
Constraint: \mathbf{ns} \geq 0.
On entry, \mathbf{pdz} = \langle value \rangle.
Constraint: \mathbf{pdz} > 0.
```

#### NE INT 2

```
On entry, \mathbf{pdz} = \langle value \rangle and \mathbf{m} = \langle value \rangle. Constraint: \mathbf{pdz} \geq \mathbf{m}.
```

### NE\_INT\_ARRAY\_ELEM\_CONS

```
mxn is too small: min value = \langle value \rangle.
On entry, there are not ip values of isz > 0.
```

#### NE\_INTERNAL\_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

## 7 Accuracy

Not applicable.

#### 8 Parallelism and Performance

Not applicable.

### 9 Further Comments

When there are strata present, i.e., ns > 1, not all the nxs groups may be present.

### 10 Example

The data are the remission times for two groups of leukemia patients (see page 242 of Gross and Clark (1975)). A dummy variable indicates which group they come from. The risk sets are computed using nag\_surviv\_risk\_sets (g12zac) and the Cox's proportional hazard model is fitted using nag\_condl\_logistic (g11cac).
