NAG Library Function Document

nag_complex_airy_bi (s17dhc)

1 Purpose

nag_complex_airy_bi (s17dhc) returns the value of the Airy function $\mathrm{Bi}(z)$ or its derivative $\mathrm{Bi}'(z)$ for complex z, with an option for exponential scaling.

2 Specification

```
#include <nag.h>
#include <nags.h>
void nag_complex_airy_bi (Nag_FunType deriv, Complex z,
     Nag_ScaleResType scal, Complex *bi, NagError *fail)
```

3 Description

nag_complex_airy_bi (s17dhc) returns a value for the Airy function $\mathrm{Bi}(z)$ or its derivative $\mathrm{Bi}'(z)$, where z is complex, $-\pi < \arg z \leq \pi$. Optionally, the value is scaled by the factor $e^{|\mathrm{Re}(2z\sqrt{z}/3)|}$.

The function is derived from the function CBIRY in Amos (1986). It is based on the relations $\mathrm{Bi}(z) = \frac{\sqrt{z}}{\sqrt{3}}\left(I_{-1/3}(w) + I_{1/3}(w)\right)$, and $\mathrm{Bi}'(z) = \frac{z}{\sqrt{3}}\left(I_{-2/3}(w) + I_{2/3}(w)\right)$, where I_ν is the modified Bessel function and $w = 2z\sqrt{z}/3$.

For very large $|z|$, argument reduction will cause total loss of accuracy, and so no computation is performed. For slightly smaller $|z|$, the computation is performed but results are accurate to less than half of ***machine precision***. If $\mathrm{Re}(z)$ is too large, and the unscaled function is required, there is a risk of overflow and so no computation is performed. In all the above cases, a warning is given by the function.

5 Arguments

1: **deriv** – Nag_FunType *Input*

On entry: specifies whether the function or its derivative is required.

deriv = Nag_Function
$\mathrm{Bi}(z)$ is returned.

deriv = Nag_Deriv
$\mathrm{Bi}'(z)$ is returned.

Constraint: **deriv** = Nag_Function or Nag_Deriv.

2: **z** – Complex *Input*

On entry: the argument z of the function.

3: **scal** – Nag_ScaleResType *Input*

On entry: the scaling option.

scal = Nag_UnscaleRes
The result is returned unscaled.

scal = Nag_ScaleRes
The result is returned scaled by the factor $e^{|\mathrm{Re}(2z\sqrt{z}/3)|}$.

Constraint: **scal** = Nag_UnscaleRes or Nag_ScaleRes.

4: **bi** – Complex * *Output*

On exit: the required function or derivative value.

5: **fail** – NagError * *Input/Output*

The NAG error argument (see Section 3.6 in the Essential Introduction).

6 Error Indicators and Warnings

NE_BAD_PARAM

On entry, argument ⟨*value*⟩ had an illegal value.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

NE_OVERFLOW_LIKELY

No computation because $\mathbf{z}.re = \langle value \rangle$ is too large when **scal** = Nag_UnscaleRes.

NE_TERMINATION_FAILURE

No computation – algorithm termination condition not met.

NE_TOTAL_PRECISION_LOSS

No computation because $|\mathbf{z}| = \langle value \rangle > \langle value \rangle$.

NW_SOME_PRECISION_LOSS

Results lack precision because $|\mathbf{z}| = \langle value \rangle > \langle value \rangle$.

7 Accuracy

All constants in nag_complex_airy_bi (s17dhc) are given to approximately 18 digits of precision. Calling the number of digits of precision in the floating-point arithmetic being used t, then clearly the maximum number of correct digits in the results obtained is limited by $p = \min(t, 18)$. Because of errors in argument reduction when computing elementary functions inside nag_complex_airy_bi (s17dhc), the actual number of correct digits is limited, in general, by $p - s$, where $s \approx \max(1, |\log_{10}|z||)$ represents the number of digits lost due to the argument reduction. Thus the larger the value of $|z|$, the less the precision in the result.

Empirical tests with modest values of z, checking relations between Airy functions $\mathrm{Ai}(z)$, $\mathrm{Ai}'(z)$, $\mathrm{Bi}(z)$ and $\mathrm{Bi}'(z)$, have shown errors limited to the least significant 3 – 4 digits of precision.

8 Parallelism and Performance

Not applicable.

9 Further Comments

Note that if the function is required to operate on a real argument only, then it may be much cheaper to call nag_airy_bi (s17ahc) or nag_airy_bi_deriv (s17akc).

10 Example

This example prints a caption and then proceeds to read sets of data from the input data stream. The first datum is a value for the argument **deriv**, the second is a complex value for the argument, **z**, and the third is a character value used as a flag to set the argument **scal**. The program calls the function and prints the results. The process is repeated until the end of the input data stream is encountered.
