

## NAG Library Function Document

### nag\_bessel\_k1\_vector (s18arc)

## 1 Purpose

nag\_bessel\_k1\_vector (s18arc) returns an array of values of the modified Bessel function  $K_1(x)$ .

## 2 Specification

```
#include <nag.h>
#include <nags.h>
void nag_bessel_k1_vector (Integer n, const double x[], double f[],
    Integer ivalid[], NagError *fail)
```

## 3 Description

nag\_bessel\_k1\_vector (s18arc) evaluates an approximation to the modified Bessel function of the second kind  $K_1(x_i)$  for an array of arguments  $x_i$ , for  $i = 1, 2, \dots, n$ .

**Note:**  $K_1(x)$  is undefined for  $x \leq 0$  and the function will fail for such arguments.

The function is based on five Chebyshev expansions:

For  $0 < x \leq 1$ ,

$$K_1(x) = \frac{1}{x} + x \ln x \sum_{r=0} a_r T_r(t) - x \sum_{r=0} b_r T_r(t), \quad \text{where } t = 2x^2 - 1.$$

For  $1 < x \leq 2$ ,

$$K_1(x) = e^{-x} \sum_{r=0} c_r T_r(t), \quad \text{where } t = 2x - 3.$$

For  $2 < x \leq 4$ ,

$$K_1(x) = e^{-x} \sum_{r=0} d_r T_r(t), \quad \text{where } t = x - 3.$$

For  $x > 4$ ,

$$K_1(x) = \frac{e^{-x}}{\sqrt{x}} \sum_{r=0} e_r T_r(t), \quad \text{where } t = \frac{9-x}{1+x}.$$

For  $x$  near zero,  $K_1(x) \simeq \frac{1}{x}$ . This approximation is used when  $x$  is sufficiently small for the result to be correct to **machine precision**. For very small  $x$  it is impossible to calculate  $\frac{1}{x}$  without overflow and the function must fail.

For large  $x$ , where there is a danger of underflow due to the smallness of  $K_1$ , the result is set exactly to zero.

## 5 Arguments

1:	<b>n</b> – Integer	<i>Input</i>
	<i>On entry:</i> $n$ , the number of points.	
	<i>Constraint:</i> $\mathbf{n} \geq 0$ .	
2:	<b>x[n]</b> – const double	<i>Input</i>
	<i>On entry:</i> the argument $x_i$ of the function, for $i = 1, 2, \dots, n$ .	
	<i>Constraint:</i> $\mathbf{x}[i - 1] > 0.0$ , for $i = 1, 2, \dots, n$ .	
3:	<b>f[n]</b> – double	<i>Output</i>
	<i>On exit:</i> $K_1(x_i)$ , the function values.	
4:	<b>invalid[n]</b> – Integer	<i>Output</i>
	<i>On exit:</i> $\mathbf{invalid}[i - 1]$ contains the error code for $x_i$ , for $i = 1, 2, \dots, n$ .	
	$\mathbf{invalid}[i - 1] = 0$ No error.	
	$\mathbf{invalid}[i - 1] = 1$ $x_i \leq 0.0$ , $K_1(x_i)$ is undefined. $\mathbf{f}[i - 1]$ contains 0.0.	
	$\mathbf{invalid}[i - 1] = 2$ $x_i$ is too small, there is a danger of overflow. $\mathbf{f}[i - 1]$ contains zero. The threshold value is the same as for <b>fail.code</b> = NE_REAL_ARG_TOO_SMALL in nag_bessel_k1 (s18adc), as defined in the Users' Note for your implementation.	
5:	<b>fail</b> – NagError *	<i>Input/Output</i>
	The NAG error argument (see Section 3.6 in the Essential Introduction).	

## 6 Error Indicators and Warnings

### NE\_BAD\_PARAM

On entry, argument  $\langle\text{value}\rangle$  had an illegal value.

### NE\_INT

On entry,  $\mathbf{n} = \langle\text{value}\rangle$ .  
Constraint:  $\mathbf{n} \geq 0$ .

### NE\_INTERNAL\_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

### NW\_INVALID

On entry, at least one value of **x** was invalid.  
Check **invalid** for more information.

## 7 Accuracy

Let  $\delta$  and  $\epsilon$  be the relative errors in the argument and result respectively.

If  $\delta$  is somewhat larger than the *machine precision* (i.e., if  $\delta$  is due to data errors etc.), then  $\epsilon$  and  $\delta$  are approximately related by:

$$\epsilon \simeq \left| \frac{xK_0(x) - K_1(x)}{K_1(x)} \right| \delta.$$

Figure 1 shows the behaviour of the error amplification factor

$$\left| \frac{xK_0(x) - K_1(x)}{K_1(x)} \right|.$$

However if  $\delta$  is of the same order as the ***machine precision***, then rounding errors could make  $\epsilon$  slightly larger than the above relation predicts.

For small  $x$ ,  $\epsilon \simeq \delta$  and there is no amplification of errors.

For large  $x$ ,  $\epsilon \simeq x\delta$  and we have strong amplification of the relative error. Eventually  $K_1$ , which is asymptotically given by  $\frac{e^{-x}}{\sqrt{x}}$ , becomes so small that it cannot be calculated without underflow and hence the function will return zero. Note that for large  $x$  the errors will be dominated by those of the standard function  $\exp$ .

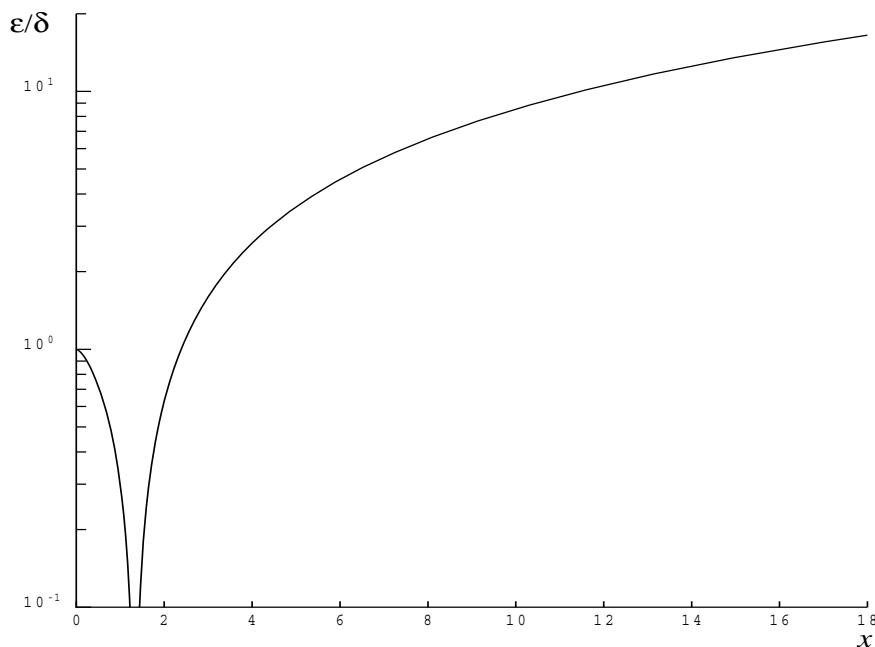

Figure 1

## 8 Parallelism and Performance

Not applicable.

## 9 Further Comments

None.

## 10 Example

This example reads values of  $x$  from a file, evaluates the function at each value of  $x_i$  and prints the results.
