nag_elliptic_integral_complete_K (s21bhc)

1 Purpose

`nag_elliptic_integral_complete_K` (s21bhc) returns a value of the classical (Legendre) form of the complete elliptic integral of the first kind.

2 Specification

```
#include <nag.h>
#include <nags.h>
double nag_elliptic_integral_complete_K (double dm, NagError *fail)
```

3 Description

`nag_elliptic_integral_complete_K` (s21bhc) calculates an approximation to the integral

$$K(m) = \int_0^{\frac{\pi}{2}} (1 - m \sin^2 \theta)^{-\frac{1}{2}} d\theta,$$

where $m < 1$.

The integral is computed using the symmetrised elliptic integrals of Carlson (Carlson (1979) and Carlson (1988)). The relevant identity is

$$K(m) = R_F(0, 1 - m, 1),$$

where R_F is the Carlson symmetrised incomplete elliptic integral of the first kind (see `nag_elliptic_integral_rf` (s21bbc)).

5 Arguments

1: **dm** – double *Input*

On entry: the argument m of the function.

Constraint: $\mathbf{dm} < 1.0$.

2: **fail** – NagError * *Input/Output*

The NAG error argument (see Section 3.6 in the Essential Introduction).

6 Error Indicators and Warnings

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

NE_REAL

On entry, **dm** = $\langle value \rangle$; the integral is undefined.
 Constraint: **dm** < 1.0.
 On failure, the function returns zero.

NW_INTEGRAL_INFINITE

On entry, **dm** = 1.0; the integral is infinite.
 On failure, the function returns the largest machine number (see `nag_real_largest_number` (X02ALC)).

7 Accuracy

In principle `nag_elliptic_integral_complete_K` (s21bhc) is capable of producing full ***machine precision***. However round-off errors in internal arithmetic will result in slight loss of accuracy. This loss should never be excessive as the algorithm does not involve any significant amplification of round-off error. It is reasonable to assume that the result is accurate to within a small multiple of the ***machine precision***.

8 Parallelism and Performance

Not applicable.

9 Further Comments

You should consult the s Chapter Introduction, which shows the relationship between this function and the Carlson definitions of the elliptic integrals. In particular, the relationship between the argument-constraints for both forms becomes clear.

For more information on the algorithm used to compute R_F , see the function document for `nag_elliptic_integral_rf` (s21bbc).

10 Example

This example simply generates a small set of nonextreme arguments that are used with the function to produce the table of results.

10.1 Program Text

```

/* Pre-processor includes */
#include <stdio.h>
#include <nag.h>
#include <nag_stdlib.h>
#include <nags.h>

int main(void)
{
    /*Integer scalar and array declarations */
    Integer exit_status = 0;
    Integer ix;
    /*Double scalar and array declarations */
    double dm, k;
    NagError fail;

    INIT_FAIL(fail);

    printf("%s\n",

```

```

    "nag_elliptic_integral_complete_K (s21bhc) Example Program Results";
printf("\n      dm      nag_elliptic_integral_complete_K\n\n");
for (ix = 1; ix <= 3; ix++)
{
    dm = ix*0.250e0;
    /*
     * nag_elliptic_integral_complete_K (s21bhc)
     * Complete elliptic integral of 1st kind, Legendre form, K(m)
     */
    k = nag_elliptic_integral_complete_K(dm, &fail);
    if (fail.code != NE_NOERROR)
    {
        printf("Error from "
               "nag_elliptic_integral_complete_K (s21bhc).\n%s\n",
               fail.message);
        exit_status = 1;
        goto END;
    }
    printf("%7.2f%12.4f\n", dm, k);
}

```

END:

```

    return exit_status;
}

```

10.2 Program Data

None.

10.3 Program Results
