NAG Library Function Document

nag 2d cheb eval (e02cbc)

1 Purpose

nag_2d_cheb_eval (e02cbc) evaluates a bivariate polynomial from the rectangular array of coefficients in its double Chebyshev series representation.

2 Specification

3 Description

This function evaluates a bivariate polynomial (represented in double Chebyshev form) of degree k in one variable, \bar{x} , and degree l in the other, \bar{y} . The range of both variables is -1 to +1. However, these normalized variables will usually have been derived (as when the polynomial has been computed by nag_2d_cheb_fit_lines (e02cac), for example) from your original variables x and y by the transformations

$$\bar{x} = \frac{2x - (x_{\text{max}} + x_{\text{min}})}{(x_{\text{max}} - x_{\text{min}})} \quad \text{ and } \quad \bar{y} = \frac{2y - (y_{\text{max}} + y_{\text{min}})}{(y_{\text{max}} - y_{\text{min}})}.$$

(Here x_{\min} and x_{\max} are the ends of the range of x which has been transformed to the range -1 to +1 of \bar{x} . y_{\min} and y_{\max} are correspondingly for y. See Section 9). For this reason, the function has been designed to accept values of x and y rather than \bar{x} and \bar{y} , and so requires values of x_{\min} , etc. to be supplied by you. In fact, for the sake of efficiency in appropriate cases, the function evaluates the polynomial for a sequence of values of x, all associated with the same value of y.

The double Chebyshev series can be written as

$$\sum_{i=0}^{k} \sum_{j=0}^{l} a_{ij} T_i(\bar{x}) T_j(\bar{y}),$$

where $T_i(\bar{x})$ is the Chebyshev polynomial of the first kind of degree i and argument \bar{x} , and $T_j(\bar{y})$ is similarly defined. However the standard convention, followed in this function, is that coefficients in the above expression which have either i or j zero are written $\frac{1}{2}a_{ij}$, instead of simply a_{ij} , and the coefficient with both i and j zero is written $\frac{1}{4}a_{0,0}$.

The function first forms $c_i = \sum_{j=0}^l a_{ij} T_j(\bar{y})$, with $a_{i,0}$ replaced by $\frac{1}{2} a_{i,0}$, for each of $i=0,1,\ldots,k$. The

value of the double series is then obtained for each value of x, by summing $c_i \times T_i(\bar{x})$, with c_0 replaced by $\frac{1}{2}c_0$, over $i=0,1,\ldots,k$. The Clenshaw three term recurrence (see Clenshaw (1955)) with modifications due to Reinsch and Gentleman (1969) is used to form the sums.

5 Arguments

1: **mfirst** – Integer Input

2: **mlast** – Integer

Input

On entry: the index of the first and last x value in the array x at which the evaluation is required respectively (see Section 9).

Constraint: mlast > mfirst.

3: \mathbf{k} – Integer

4: **l** – Integer Input

On entry: the degree k of x and l of y, respectively, in the polynomial.

Constraint: $\mathbf{k} \geq 0$ and $\mathbf{l} \geq 0$.

5: $\mathbf{x}[\mathbf{mlast}] - \text{const double}$

Input

On entry: $\mathbf{x}[i-1]$, for $i = \mathbf{mfirst}, \dots, \mathbf{mlast}$, must contain the x values at which the evaluation is required.

Constraint: $xmin \le x[i-1] \le xmax$, for all i.

6: **xmin** – double *Input*

7: **xmax** – double

Input

On entry: the lower and upper ends, x_{\min} and x_{\max} , of the range of the variable x (see Section 3).

The values of **xmin** and **xmax** may depend on the value of y (e.g., when the polynomial has been derived using nag 2d cheb fit lines (e02cac)).

Constraint: xmax > xmin.

8: y - double Input

On entry: the value of the y coordinate of all the points at which the evaluation is required.

Constraint: $ymin \le y \le ymax$.

9: **ymin** – double *Input*

10: ymax – double

Input

On entry: the lower and upper ends, y_{\min} and y_{\max} , of the range of the variable y (see Section 3). Constraint: ymax > ymin.

11: **ff**[**mlast**] – double Output

On exit: $\mathbf{ff}[i-1]$ gives the value of the polynomial at the point (x_i, y) , for $i = \mathbf{mfirst}, \dots, \mathbf{mlast}$.

12: $\mathbf{a}[dim]$ – const double

Note: the dimension, dim, of the array **a** must be at least $((k+1) \times (l+1))$.

On entry: the Chebyshev coefficients of the polynomial. The coefficient a_{ij} defined according to the standard convention (see Section 3) must be in $\mathbf{a}[i \times (l+1) + j]$.

e02cbc.2 Mark 25

13: **fail** – NagError *

Input/Output

The NAG error argument (see Section 3.6 in the Essential Introduction).

6 Error Indicators and Warnings

NE ALLOC FAIL

Dynamic memory allocation failed.

See Section 3.2.1.2 in the Essential Introduction for further information.

NE_BAD_PARAM

On entry, argument $\langle value \rangle$ had an illegal value.

NE_INT_2

```
On entry, \mathbf{k} = \langle value \rangle and \mathbf{l} = \langle value \rangle.
Constraint: \mathbf{k} \geq 0 and \mathbf{l} \geq 0.
On entry, \mathbf{mfirst} = \langle value \rangle and \mathbf{mlast} = \langle value \rangle.
Constraint: \mathbf{mfirst} < \mathbf{mlast}.
```

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.

See Section 3.6.6 in the Essential Introduction for further information.

Unexpected failure in internal call to nag_1d_cheb_eval (e02aec).

NE_NO_LICENCE

Your licence key may have expired or may not have been installed correctly. See Section 3.6.5 in the Essential Introduction for further information.

NE REAL 2

```
On entry, \mathbf{xmin} = \langle value \rangle and \mathbf{xmax} = \langle value \rangle. Constraint: \mathbf{xmin} < \mathbf{xmax}.

On entry, \mathbf{y} = \langle value \rangle and \mathbf{ymax} = \langle value \rangle. Constraint: \mathbf{y} \leq \mathbf{ymax}.

On entry, \mathbf{y} = \langle value \rangle and \mathbf{ymin} = \langle value \rangle. Constraint: \mathbf{y} \geq \mathbf{ymin}.

On entry, \mathbf{ymin} = \langle value \rangle and \mathbf{ymax} = \langle value \rangle. Constraint: \mathbf{ymin} < \mathbf{ymax}.
```

NE REAL ARRAY

```
On entry, I = \langle value \rangle, \mathbf{x}[I-1] = \langle value \rangle and \mathbf{xmax} = \langle value \rangle. Constraint: \mathbf{x}[I-1] \leq \mathbf{xmax}.

On entry, I = \langle value \rangle, \mathbf{x}[I-1] = \langle value \rangle and \mathbf{xmin} = \langle value \rangle. Constraint: \mathbf{x}[I-1] \geq \mathbf{xmin}.
```

7 Accuracy

The method is numerically stable in the sense that the computed values of the polynomial are exact for a set of coefficients which differ from those supplied by only a modest multiple of *machine precision*.

Mark 25 e02cbc.3

e02cbc NAG Library Manual

8 Parallelism and Performance

nag 2d cheb eval (e02cbc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

9 **Further Comments**

The time taken is approximately proportional to $(k+1) \times (m+l+1)$, where m = mlast - mfirst + 1, the number of points at which the evaluation is required.

This function is suitable for evaluating the polynomial surface fits produced by the function nag 2d cheb fit lines (e02cac), which provides the array a in the required form. For this use, the values of y_{\min} and y_{\max} supplied to the present function must be the same as those supplied to nag_2d_cheb_fit_lines (e02cac). The same applies to x_{min} and x_{max} if they are independent of y. If they vary with y, their values must be consistent with those supplied to nag 2d cheb fit lines (e02cac) (see Section 9 in nag_2d_cheb_fit lines (e02cac)).

The arguments **mfirst** and **mlast** are intended to permit the selection of a segment of the array x which is to be associated with a particular value of y, when, for example, other segments of x are associated with other values of y. Such a case arises when, after using nag 2d cheb fit lines (e02cac) to fit a set of data, you wish to evaluate the resulting polynomial at all the data values. In this case, if the arguments x, y, mfirst and mlast of the present function are set respectively (in terms of arguments of

nag_2d_cheb_fit_lines (e02cac)) to
$$\mathbf{x}$$
, $\mathbf{y}(S)$, $1 + \sum_{i=1}^{s-1} \mathbf{m}(i)$ and $\sum_{i=1}^{s} \mathbf{m}(i)$, the function will compute values of the polynomial surface at all data points which have $\mathbf{y}[S-1]$ as their y coordinate (from which

values the residuals of the fit may be derived).

10 Example

This example reads data in the following order, using the notation of the argument list above:

```
N
   k l
                                                          for i = 1, 2, ..., (k + 1) \times (l + 1)
a[i-1],
ymin ymax
y[i-1] M(i-1) xmin[i-1] xmax[i-1] X1(i) XM(i), for i=1,2,\ldots,N.
```

For each line y = y[i-1] the polynomial is evaluated at M(i) equispaced points between X1(i) and XM(i) inclusive.
