

NAG Library Function Document

nag_ztzzrf (f08bvc)

1 Purpose

nag_ztzzrf (f08bvc) reduces the m by n ($m \leq n$) complex upper trapezoidal matrix A to upper triangular form by means of unitary transformations.

2 Specification

```
#include <nag.h>
#include <nagf08.h>

void nag_ztzzrf (Nag_OrderType order, Integer m, Integer n, Complex a[],
                Integer pda, Complex tau[], NagError *fail)
```

3 Description

The m by n ($m \leq n$) complex upper trapezoidal matrix A given by

$$A = \begin{pmatrix} R_1 & R_2 \end{pmatrix},$$

where R_1 is an m by m upper triangular matrix and R_2 is an m by $(n - m)$ matrix, is factorized as

$$A = \begin{pmatrix} R & 0 \end{pmatrix} Z,$$

where R is also an m by m upper triangular matrix and Z is an n by n unitary matrix.

5 Arguments

- 1: **order** – Nag_OrderType *Input*
On entry: the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.
Constraint: **order** = Nag_RowMajor or Nag_ColMajor.
- 2: **m** – Integer *Input*
On entry: m , the number of rows of the matrix A .
Constraint: $m \geq 0$.
- 3: **n** – Integer *Input*
On entry: n , the number of columns of the matrix A .
Constraint: $n \geq 0$.

4: **a**[*dim*] – Complex *Input/Output*

Note: the dimension, *dim*, of the array **a** must be at least

$\max(1, \mathbf{pda} \times \mathbf{n})$ when **order** = Nag_ColMajor;
 $\max(1, \mathbf{m} \times \mathbf{pda})$ when **order** = Nag_RowMajor.

The (*i*, *j*)th element of the matrix *A* is stored in

a[(*j* – 1) × **pda** + *i* – 1] when **order** = Nag_ColMajor;
a[(*i* – 1) × **pda** + *j* – 1] when **order** = Nag_RowMajor.

On entry: the leading *m* by *n* upper trapezoidal part of the array **a** must contain the matrix to be factorized.

On exit: the leading *m* by *m* upper triangular part of **a** contains the upper triangular matrix *R*, and elements **m** + 1 to **n** of the first *m* rows of **a**, with the array **tau**, represent the unitary matrix *Z* as a product of *m* elementary reflectors (see Section 3.3.6 in the f08 Chapter Introduction).

5: **pda** – Integer *Input*

On entry: the stride separating row or column elements (depending on the value of **order**) in the array **a**.

Constraints:

if **order** = Nag_ColMajor, **pda** ≥ max(1, **m**);
 if **order** = Nag_RowMajor, **pda** ≥ max(1, **n**).

6: **tau**[*dim*] – Complex *Output*

Note: the dimension, *dim*, of the array **tau** must be at least max(1, **m**).

On exit: the scalar factors of the elementary reflectors.

7: **fail** – NagError * *Input/Output*

The NAG error argument (see Section 3.6 in the Essential Introduction).

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.

See Section 3.2.1.2 in the Essential Introduction for further information.

NE_BAD_PARAM

On entry, argument *⟨value⟩* had an illegal value.

NE_INT

On entry, **m** = *⟨value⟩*.

Constraint: **m** ≥ 0.

On entry, **n** = *⟨value⟩*.

Constraint: **n** ≥ 0.

On entry, **pda** = *⟨value⟩*.

Constraint: **pda** > 0.

NE_INT_2

On entry, **pda** = *⟨value⟩* and **m** = *⟨value⟩*.

Constraint: **pda** ≥ max(1, **m**).

On entry, **pda** = $\langle value \rangle$ and **n** = $\langle value \rangle$.
 Constraint: **pda** $\geq \max(1, \mathbf{n})$.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.
 See Section 3.6.6 in the Essential Introduction for further information.

NE_NO_LICENCE

Your licence key may have expired or may not have been installed correctly.
 See Section 3.6.5 in the Essential Introduction for further information.

7 Accuracy

The computed factorization is the exact factorization of a nearby matrix $A + E$, where

$$\|E\|_2 = O\epsilon \|A\|_2$$

and ϵ is the *machine precision*.

8 Parallelism and Performance

nag_ztrzf (f08bvc) is not threaded by NAG in any implementation.

nag_ztrzf (f08bvc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

The total number of floating-point operations is approximately $16m^2(n - m)$.

The real analogue of this function is nag_dtrzf (f08bhc).

10 Example

This example solves the linear least squares problems

$$\min_x \|b_j - Ax_j\|_2, \quad j = 1, 2$$

for the minimum norm solutions x_1 and x_2 , where b_j is the j th column of the matrix B ,

$$A = \begin{pmatrix} 0.47 - 0.34i & -0.40 + 0.54i & 0.60 + 0.01i & 0.80 - 1.02i \\ -0.32 - 0.23i & -0.05 + 0.20i & -0.26 - 0.44i & -0.43 + 0.17i \\ 0.35 - 0.60i & -0.52 - 0.34i & 0.87 - 0.11i & -0.34 - 0.09i \\ 0.89 + 0.71i & -0.45 - 0.45i & -0.02 - 0.57i & 1.14 - 0.78i \\ -0.19 + 0.06i & 0.11 - 0.85i & 1.44 + 0.80i & 0.07 + 1.14i \end{pmatrix}$$

and

$$B = \begin{pmatrix} -1.08 - 2.59i & 2.22 + 2.35i \\ -2.61 - 1.49i & 1.62 - 1.48i \\ 3.13 - 3.61i & 1.65 + 3.43i \\ 7.33 - 8.01i & -0.98 + 3.08i \\ 9.12 + 7.63i & -2.84 + 2.78i \end{pmatrix}.$$

The solution is obtained by first obtaining a QR factorization with column pivoting of the matrix A , and then the RZ factorization of the leading k by k part of R is computed, where k is the estimated rank of A . A tolerance of 0.01 is used to estimate the rank of A from the upper triangular factor, R .
