

# NAG Library Function Document

## nag\_zheevd (f08fqc)

### 1 Purpose

nag\_zheevd (f08fqc) computes all the eigenvalues and, optionally, all the eigenvectors of a complex Hermitian matrix. If the eigenvectors are requested, then it uses a divide-and-conquer algorithm to compute eigenvalues and eigenvectors. However, if only eigenvalues are required, then it uses the Pal–Walker–Kahan variant of the  $QL$  or  $QR$  algorithm.

### 2 Specification

```
#include <nag.h>
#include <nagf08.h>

void nag_zheevd (Nag_OrderType order, Nag_JobType job, Nag_UploType uplo,
                Integer n, Complex a[], Integer pda, double w[], NagError *fail)
```

### 3 Description

nag\_zheevd (f08fqc) computes all the eigenvalues and, optionally, all the eigenvectors of a complex Hermitian matrix  $A$ . In other words, it can compute the spectral factorization of  $A$  as

$$A = ZAZ^H,$$

where  $A$  is a real diagonal matrix whose diagonal elements are the eigenvalues  $\lambda_i$ , and  $Z$  is the (complex) unitary matrix whose columns are the eigenvectors  $z_i$ . Thus

$$Az_i = \lambda_i z_i, \quad i = 1, 2, \dots, n.$$

### 5 Arguments

1: **order** – Nag\_OrderType *Input*

*On entry:* the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag\_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

*Constraint:* **order** = Nag\_RowMajor or Nag\_ColMajor.

2: **job** – Nag\_JobType *Input*

*On entry:* indicates whether eigenvectors are computed.

**job** = Nag\_DoNothing  
Only eigenvalues are computed.

- job** = Nag\_EigVecs  
Eigenvalues and eigenvectors are computed.  
*Constraint:* **job** = Nag\_DoNothing or Nag\_EigVecs.
- 3: **uplo** – Nag\_UploType *Input*  
*On entry:* indicates whether the upper or lower triangular part of  $A$  is stored.  
**uplo** = Nag\_Upper  
The upper triangular part of  $A$  is stored.  
**uplo** = Nag\_Lower  
The lower triangular part of  $A$  is stored.  
*Constraint:* **uplo** = Nag\_Upper or Nag\_Lower.
- 4: **n** – Integer *Input*  
*On entry:*  $n$ , the order of the matrix  $A$ .  
*Constraint:*  $n \geq 0$ .
- 5: **a**[ $dim$ ] – Complex *Input/Output*  
**Note:** the dimension,  $dim$ , of the array **a** must be at least  $\max(1, pda \times n)$ .  
*On entry:* the  $n$  by  $n$  Hermitian matrix  $A$ .  
If **order** = Nag\_ColMajor,  $A_{ij}$  is stored in **a**[( $j - 1$ )  $\times$  **pda** +  $i - 1$ ].  
If **order** = Nag\_RowMajor,  $A_{ij}$  is stored in **a**[( $i - 1$ )  $\times$  **pda** +  $j - 1$ ].  
If **uplo** = Nag\_Upper, the upper triangular part of  $A$  must be stored and the elements of the array below the diagonal are not referenced.  
If **uplo** = Nag\_Lower, the lower triangular part of  $A$  must be stored and the elements of the array above the diagonal are not referenced.  
*On exit:* if **job** = Nag\_EigVecs, **a** is overwritten by the unitary matrix  $Z$  which contains the eigenvectors of  $A$ .
- 6: **pda** – Integer *Input*  
*On entry:* the stride separating row or column elements (depending on the value of **order**) of the matrix  $A$  in the array **a**.  
*Constraint:* **pda**  $\geq$   $\max(1, n)$ .
- 7: **w**[ $dim$ ] – double *Output*  
**Note:** the dimension,  $dim$ , of the array **w** must be at least  $\max(1, n)$ .  
*On exit:* the eigenvalues of the matrix  $A$  in ascending order.
- 8: **fail** – NagError \* *Input/Output*  
The NAG error argument (see Section 3.6 in the Essential Introduction).

## 6 Error Indicators and Warnings

### NE\_ALLOC\_FAIL

Dynamic memory allocation failed.

See Section 3.2.1.2 in the Essential Introduction for further information.

**NE\_BAD\_PARAM**

On entry, argument  $\langle value \rangle$  had an illegal value.

**NE\_CONVERGENCE**

If **fail.errnum** =  $\langle value \rangle$  and **job** = Nag\_DoNothing, the algorithm failed to converge;  $\langle value \rangle$  elements of an intermediate tridiagonal form did not converge to zero; if **fail.errnum** =  $\langle value \rangle$  and **job** = Nag\_EigVecs, then the algorithm failed to compute an eigenvalue while working on the submatrix lying in rows and column  $\langle value \rangle / (\mathbf{n} + 1)$  through  $\langle value \rangle \bmod (\mathbf{n} + 1)$ .

**NE\_INT**

On entry, **n** =  $\langle value \rangle$ .

Constraint: **n**  $\geq 0$ .

On entry, **pda** =  $\langle value \rangle$ .

Constraint: **pda**  $> 0$ .

**NE\_INT\_2**

On entry, **pda** =  $\langle value \rangle$  and **n** =  $\langle value \rangle$ .

Constraint: **pda**  $\geq \max(1, \mathbf{n})$ .

**NE\_INTERNAL\_ERROR**

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.

See Section 3.6.6 in the Essential Introduction for further information.

**NE\_NO\_LICENCE**

Your licence key may have expired or may not have been installed correctly.

See Section 3.6.5 in the Essential Introduction for further information.

**7 Accuracy**

The computed eigenvalues and eigenvectors are exact for a nearby matrix  $(A + E)$ , where

$$\|E\|_2 = O(\epsilon)\|A\|_2,$$

and  $\epsilon$  is the *machine precision*. See Section 4.7 of Anderson *et al.* (1999) for further details.

**8 Parallelism and Performance**

nag\_zheevd (f08fqc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

nag\_zheevd (f08fqc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

**9 Further Comments**

The real analogue of this function is nag\_dsyevd (f08fcc).

## 10 Example

This example computes all the eigenvalues and eigenvectors of the Hermitian matrix  $A$ , where

$$A = \begin{pmatrix} 1.0 + 0.0i & 2.0 - 1.0i & 3.0 - 1.0i & 4.0 - 1.0i \\ 2.0 + 1.0i & 2.0 + 0.0i & 3.0 - 2.0i & 4.0 - 2.0i \\ 3.0 + 1.0i & 3.0 + 2.0i & 3.0 + 0.0i & 4.0 - 3.0i \\ 4.0 + 1.0i & 4.0 + 2.0i & 4.0 + 3.0i & 4.0 + 0.0i \end{pmatrix}.$$

The example program for nag\_zheevd (f08fqc) illustrates the computation of error bounds for the eigenvalues and eigenvectors.
