

## NAG Library Function Document

### nag\_zhpev (f08gnc)

## 1 Purpose

nag\_zhpev (f08gnc) computes all the eigenvalues and, optionally, all the eigenvectors of a complex  $n$  by  $n$  Hermitian matrix  $A$  in packed storage.

## 2 Specification

```
#include <nag.h>
#include <nagf08.h>
void nag_zhpev (Nag_OrderType order, Nag_JobType job, Nag_UptoType uplo,
    Integer n, Complex ap[], double w[], Complex z[], Integer pdz,
    NagError *fail)
```

## 3 Description

The Hermitian matrix  $A$  is first reduced to real tridiagonal form, using unitary similarity transformations, and then the  $QR$  algorithm is applied to the tridiagonal matrix to compute the eigenvalues and (optionally) the eigenvectors.

## 4 References

Golub G H and Van Loan C F (1996) *Matrix Computations* (3rd Edition) Johns Hopkins University Press, Baltimore

## 5 Arguments

1: **order** – Nag\_OrderType *Input*

*On entry:* the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag\_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

*Constraint:* **order** = Nag\_RowMajor or Nag\_ColMajor.

2: **job** – Nag\_JobType *Input*

*On entry:* indicates whether eigenvectors are computed.

**job** = Nag\_EigVals  
Only eigenvalues are computed.

**job** = Nag\_DoBoth  
Eigenvalues and eigenvectors are computed.

*Constraint:* **job** = Nag\_EigVals or Nag\_DoBoth.

3: **uplo** – Nag\_UptoType *Input*

*On entry:* if **uplo** = Nag\_Upper, the upper triangular part of  $A$  is stored.

If **uplo** = Nag\_Lower, the lower triangular part of  $A$  is stored.

*Constraint:* **uplo** = Nag\_Upper or Nag\_Lower.

4: **n** – Integer *Input*

*On entry:*  $n$ , the order of the matrix  $A$ .

*Constraint:* **n**  $\geq 0$ .

5: **ap**[*dim*] – Complex *Input/Output*

**Note:** the dimension, *dim*, of the array **ap** must be at least  $\max(1, \mathbf{n} \times (\mathbf{n} + 1)/2)$ .

*On entry:* the upper or lower triangle of the  $n$  by  $n$  Hermitian matrix  $A$ , packed by rows or columns.

The storage of elements  $A_{ij}$  depends on the **order** and **uplo** arguments as follows:

if **order** = Nag\_ColMajor and **uplo** = Nag\_Upper,  
 $A_{ij}$  is stored in **ap**[( $j - 1$ )  $\times$   $j/2 + i - 1$ ], for  $i \leq j$ ;  
 if **order** = Nag\_ColMajor and **uplo** = Nag\_Lower,  
 $A_{ij}$  is stored in **ap**[( $2n - j$ )  $\times$  ( $j - 1$ )  $\times$   $j/2 + i - 1$ ], for  $i \geq j$ ;  
 if **order** = Nag\_RowMajor and **uplo** = Nag\_Upper,  
 $A_{ij}$  is stored in **ap**[( $2n - i$ )  $\times$  ( $i - 1$ )  $\times$   $i/2 + j - 1$ ], for  $i \leq j$ ;  
 if **order** = Nag\_RowMajor and **uplo** = Nag\_Lower,  
 $A_{ij}$  is stored in **ap**[( $i - 1$ )  $\times$   $i/2 + j - 1$ ], for  $i \geq j$ .

*On exit:* **ap** is overwritten by the values generated during the reduction to tridiagonal form. The elements of the diagonal and the off-diagonal of the tridiagonal matrix overwrite the corresponding elements of  $A$ .

6: **w**[**n**] – double *Output*

*On exit:* the eigenvalues in ascending order.

7: **z**[*dim*] – Complex *Output*

**Note:** the dimension, *dim*, of the array **z** must be at least

$\max(1, \mathbf{pdz} \times \mathbf{n})$  when **job** = Nag\_DoBoth;  
 1 otherwise.

The  $(i, j)$ th element of the matrix  $Z$  is stored in

**z**[( $j - 1$ )  $\times$  **pdz** +  $i - 1$ ] when **order** = Nag\_ColMajor;  
**z**[( $i - 1$ )  $\times$  **pdz** +  $j - 1$ ] when **order** = Nag\_RowMajor.

*On exit:* if **job** = Nag\_DoBoth, **z** contains the orthonormal eigenvectors of the matrix  $A$ , with the  $i$ th column of  $Z$  holding the eigenvector associated with **w**[ $i - 1$ ].

If **job** = Nag\_EigVals, **z** is not referenced.

8: **pdz** – Integer *Input*

*On entry:* the stride separating row or column elements (depending on the value of **order**) in the array **z**.

*Constraints:*

if **job** = Nag\_DoBoth, **pdz**  $\geq \max(1, \mathbf{n})$ ;  
 otherwise **pdz**  $\geq 1$ .

9: **fail** – NagError \* *Input/Output*

The NAG error argument (see Section 3.6 in the Essential Introduction).

## 6 Error Indicators and Warnings

### NE\_ALLOC\_FAIL

Dynamic memory allocation failed.

See Section 3.2.1.2 in the Essential Introduction for further information.

### NE\_BAD\_PARAM

On entry, argument  $\langle value \rangle$  had an illegal value.

### NE\_CONVERGENCE

The algorithm failed to converge;  $\langle value \rangle$  off-diagonal elements of an intermediate tridiagonal form did not converge to zero.

### NE\_ENUM\_INT\_2

On entry,  $\mathbf{job} = \langle value \rangle$ ,  $\mathbf{pdz} = \langle value \rangle$  and  $\mathbf{n} = \langle value \rangle$ .

Constraint: if  $\mathbf{job} = \text{Nag\_DoBoth}$ ,  $\mathbf{pdz} \geq \max(1, \mathbf{n})$ ;  
otherwise  $\mathbf{pdz} \geq 1$ .

### NE\_INT

On entry,  $\mathbf{n} = \langle value \rangle$ .

Constraint:  $\mathbf{n} \geq 0$ .

On entry,  $\mathbf{pdz} = \langle value \rangle$ .

Constraint:  $\mathbf{pdz} > 0$ .

### NE\_INTERNAL\_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.

See Section 3.6.6 in the Essential Introduction for further information.

### NE\_NO\_LICENCE

Your licence key may have expired or may not have been installed correctly.

See Section 3.6.5 in the Essential Introduction for further information.

## 7 Accuracy

The computed eigenvalues and eigenvectors are exact for a nearby matrix  $(A + E)$ , where

$$\|E\|_2 = O(\epsilon)\|A\|_2,$$

and  $\epsilon$  is the *machine precision*. See Section 4.7 of Anderson *et al.* (1999) for further details.

## 8 Parallelism and Performance

nag\_zheev (f08gnc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

nag\_zheev (f08gnc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

## 9 Further Comments

Each eigenvector is normalized so that the element of largest absolute value is real and positive.

The total number of floating-point operations is proportional to  $n^3$ .

The real analogue of this function is nag\_dspev (f08gac).

## 10 Example

This example finds all the eigenvalues of the Hermitian matrix

$$A = \begin{pmatrix} 1 & 2-i & 3-i & 4-i \\ 2+i & 2 & 3-2i & 4-2i \\ 3+i & 3+2i & 3 & 4-3i \\ 4+i & 4+2i & 4+3i & 4 \end{pmatrix},$$

together with approximate error bounds for the computed eigenvalues.
