

## NAG Library Function Document

### nag\_dtgevc (f08ykc)

## 1 Purpose

nag\_dtgevc (f08ykc) computes some or all of the right and/or left generalized eigenvectors of a pair of real matrices ( $A, B$ ) which are in generalized real Schur form.

## 2 Specification

```
#include <nag.h>
#include <nagf08.h>
void nag_dtgevc (Nag_OrderType order, Nag_SideType side,
                 Nag_HowManyType how_many, const Nag_Boolean select[], Integer n,
                 const double a[], Integer pda, const double b[], Integer pdb,
                 double vl[], Integer pdvl, double vr[], Integer pdvr, Integer mm,
                 Integer *m, NagError *fail)
```

## 3 Description

nag\_dtgevc (f08ykc) computes some or all of the right and/or left generalized eigenvectors of the matrix pair ( $A, B$ ) which is assumed to be in generalized upper Schur form. If the matrix pair ( $A, B$ ) is not in the generalized upper Schur form, then nag\_dhgeqz (f08xec) should be called before invoking nag\_dtgevc (f08ykc).

The right generalized eigenvector  $x$  and the left generalized eigenvector  $y$  of ( $A, B$ ) corresponding to a generalized eigenvalue  $\lambda$  are defined by

$$(A - \lambda B)x = 0$$

and

$$y^H(A - \lambda B) = 0.$$

If a generalized eigenvalue is determined as 0/0, which is due to zero diagonal elements at the same locations in both  $A$  and  $B$ , a unit vector is returned as the corresponding eigenvector.

Note that the generalized eigenvalues are computed using nag\_dhgeqz (f08xec) but nag\_dtgevc (f08ykc) does not explicitly require the generalized eigenvalues to compute eigenvectors. The ordering of the eigenvectors is based on the ordering of the eigenvalues as computed by nag\_dtgevc (f08ykc).

If all eigenvectors are requested, the function may either return the matrices  $X$  and/or  $Y$  of right or left eigenvectors of ( $A, B$ ), or the products  $ZX$  and/or  $QY$ , where  $Z$  and  $Q$  are two matrices supplied by you. Usually,  $Q$  and  $Z$  are chosen as the orthogonal matrices returned by nag\_dhgeqz (f08xec). Equivalently,  $Q$  and  $Z$  are the left and right Schur vectors of the matrix pair supplied to nag\_dhgeqz (f08xec). In that case,  $QY$  and  $ZX$  are the left and right generalized eigenvectors, respectively, of the matrix pair supplied to nag\_dhgeqz (f08xec).

$A$  must be block upper triangular; with 1 by 1 and 2 by 2 diagonal blocks. Corresponding to each 2 by 2 diagonal block is a complex conjugate pair of eigenvalues and eigenvectors; only one eigenvector of the pair is computed, namely the one corresponding to the eigenvalue with positive imaginary part. Each 1 by 1 block gives a real generalized eigenvalue and a corresponding eigenvector.

## 5 Arguments

- 1: **order** – Nag\_OrderType *Input*  
*On entry:* the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag\_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.  
*Constraint:* **order** = Nag\_RowMajor or Nag\_ColMajor.
- 2: **side** – Nag\_SideType *Input*  
*On entry:* specifies the required sets of generalized eigenvectors.  
**side** = Nag\_RightSide  
Only right eigenvectors are computed.  
**side** = Nag\_LeftSide  
Only left eigenvectors are computed.  
**side** = Nag\_BothSides  
Both left and right eigenvectors are computed.  
*Constraint:* **side** = Nag\_BothSides, Nag\_LeftSide or Nag\_RightSide.
- 3: **how\_many** – Nag\_HowManyType *Input*  
*On entry:* specifies further details of the required generalized eigenvectors.  
**how\_many** = Nag\_ComputeAll  
All right and/or left eigenvectors are computed.  
**how\_many** = Nag\_BackTransform  
All right and/or left eigenvectors are computed; they are backtransformed using the input matrices supplied in arrays **vr** and/or **vl**.  
**how\_many** = Nag\_ComputeSelected  
Selected right and/or left eigenvectors, defined by the array **select**, are computed.  
*Constraint:* **how\_many** = Nag\_ComputeAll, Nag\_BackTransform or Nag\_ComputeSelected.
- 4: **select**[*dim*] – const Nag\_Boolean *Input*  
**Note:** the dimension, *dim*, of the array **select** must be at least **n** when **how\_many** = Nag\_ComputeSelected;  
otherwise **select** may be **NULL**.  
*On entry:* specifies the eigenvectors to be computed if **how\_many** = Nag\_ComputeSelected. To select the generalized eigenvector corresponding to the *j*th generalized eigenvalue, the *j*th element of **select** should be set to Nag\_TRUE; if the eigenvalue corresponds to a complex conjugate pair,

then real and imaginary parts of eigenvectors corresponding to the complex conjugate eigenvalue pair will be computed.

If **how\_many** = Nag\_ComputeAll or Nag\_BackTransform, **select** is not referenced and may be **NULL**.

*Constraint:* if **how\_many** = Nag\_ComputeSelected, **select**[*j*] = Nag\_TRUE or Nag\_FALSE, for *j* = 0, 1, …, *n* – 1.

5: **n** – Integer *Input*

*On entry:* *n*, the order of the matrices *A* and *B*.

*Constraint:* **n** ≥ 0.

6: **a**[*dim*] – const double *Input*

**Note:** the dimension, *dim*, of the array **a** must be at least **pda** × **n**.

The (*i*, *j*)th element of the matrix *A* is stored in

$$\begin{aligned} \mathbf{a}[(j-1) \times \mathbf{pda} + i - 1] &\text{ when } \mathbf{order} = \text{Nag\_ColMajor}; \\ \mathbf{a}[(i-1) \times \mathbf{pda} + j - 1] &\text{ when } \mathbf{order} = \text{Nag\_RowMajor}. \end{aligned}$$

*On entry:* the matrix pair (*A*, *B*) must be in the generalized Schur form. Usually, this is the matrix *A* returned by nag\_dhgeqz (f08xec).

7: **pda** – Integer *Input*

*On entry:* the stride separating row or column elements (depending on the value of **order**) in the array **a**.

*Constraint:* **pda** ≥ max(1, **n**).

8: **b**[*dim*] – const double *Input*

**Note:** the dimension, *dim*, of the array **b** must be at least **pdb** × **n**.

The (*i*, *j*)th element of the matrix *B* is stored in

$$\begin{aligned} \mathbf{b}[(j-1) \times \mathbf{pdb} + i - 1] &\text{ when } \mathbf{order} = \text{Nag\_ColMajor}; \\ \mathbf{b}[(i-1) \times \mathbf{pdb} + j - 1] &\text{ when } \mathbf{order} = \text{Nag\_RowMajor}. \end{aligned}$$

*On entry:* the matrix pair (*A*, *B*) must be in the generalized Schur form. If *A* has a 2 by 2 diagonal block then the corresponding 2 by 2 block of *B* must be diagonal with positive elements. Usually, this is the matrix *B* returned by nag\_dhgeqz (f08xec).

9: **pdb** – Integer *Input*

*On entry:* the stride separating row or column elements (depending on the value of **order**) in the array **b**.

*Constraint:* **pdb** ≥ max(1, **n**).

10: **vl**[*dim*] – double *Input/Output*

**Note:** the dimension, *dim*, of the array **vl** must be at least

**pdvl** × **mm** when **side** = Nag\_LeftSide or Nag\_BothSides and **order** = Nag\_ColMajor;  
**n** × **pdvl** when **side** = Nag\_LeftSide or Nag\_BothSides and **order** = Nag\_RowMajor;  
otherwise **vl** may be **NULL**.

The (*i*, *j*)th element of the matrix is stored in

$$\begin{aligned} \mathbf{vl}[(j-1) \times \mathbf{pdvl} + i - 1] &\text{ when } \mathbf{order} = \text{Nag\_ColMajor}; \\ \mathbf{vl}[(i-1) \times \mathbf{pdvl} + j - 1] &\text{ when } \mathbf{order} = \text{Nag\_RowMajor}. \end{aligned}$$

*On entry:* if **how\_many** = Nag\_BackTransform and **side** = Nag\_LeftSide or Nag\_BothSides, **vl** must be initialized to an  $n$  by  $n$  matrix  $Q$ . Usually, this is the orthogonal matrix  $Q$  of left Schur vectors returned by nag\_dhgeqz (f08xec).

*On exit:* if **side** = Nag\_LeftSide or Nag\_BothSides, **vl** contains:

- if **how\_many** = Nag\_ComputeAll, the matrix  $Y$  of left eigenvectors of  $(A, B)$ ;
- if **how\_many** = Nag\_BackTransform, the matrix  $QY$ ;
- if **how\_many** = Nag\_ComputeSelected, the left eigenvectors of  $(A, B)$  specified by **select**, stored consecutively in the rows or columns (depending on the value of **order**) of the array **vl**, in the same order as their corresponding eigenvalues.

A complex eigenvector corresponding to a complex eigenvalue is stored in two consecutive rows or columns, the first holding the real part, and the second the imaginary part.

If **side** = Nag\_RightSide, **vl** is not referenced and may be **NULL**.

11: **pdvl** – Integer *Input*

*On entry:* the stride separating row or column elements (depending on the value of **order**) in the array **vl**.

*Constraints:*

- if **order** = Nag\_ColMajor,
  - if **side** = Nag\_LeftSide or Nag\_BothSides, **pdvl**  $\geq n$ ;
  - if **side** = Nag\_RightSide, **vl** may be **NULL**..
- if **order** = Nag\_RowMajor,
  - if **side** = Nag\_LeftSide or Nag\_BothSides, **pdvl**  $\geq mm$ ;
  - if **side** = Nag\_RightSide, **vl** may be **NULL**..

12: **vr**[*dim*] – double *Input/Output*

**Note:** the dimension, *dim*, of the array **vr** must be at least

- $pdvr \times mm$  when **side** = Nag\_RightSide or Nag\_BothSides and **order** = Nag\_ColMajor;
- $n \times pdvr$  when **side** = Nag\_RightSide or Nag\_BothSides and **order** = Nag\_RowMajor;
- otherwise **vr** may be **NULL**.

The  $(i, j)$ th element of the matrix is stored in

- $vr[(j - 1) \times pdvr + i - 1]$  when **order** = Nag\_ColMajor;
- $vr[(i - 1) \times pdvr + j - 1]$  when **order** = Nag\_RowMajor.

*On entry:* if **how\_many** = Nag\_BackTransform and **side** = Nag\_RightSide or Nag\_BothSides, **vr** must be initialized to an  $n$  by  $n$  matrix  $Z$ . Usually, this is the orthogonal matrix  $Z$  of right Schur vectors returned by nag\_dhgeqz (f08xec).

*On exit:* if **side** = Nag\_RightSide or Nag\_BothSides, **vr** contains:

- if **how\_many** = Nag\_ComputeAll, the matrix  $X$  of right eigenvectors of  $(A, B)$ ;
- if **how\_many** = Nag\_BackTransform, the matrix  $ZX$ ;
- if **how\_many** = Nag\_ComputeSelected, the right eigenvectors of  $(A, B)$  specified by **select**, stored consecutively in the rows or columns (depending on the value of **order**) of the array **vr**, in the same order as their corresponding eigenvalues.

A complex eigenvector corresponding to a complex eigenvalue is stored in two consecutive rows or columns, the first holding the real part, and the second the imaginary part.

If **side** = Nag\_LeftSide, **vr** is not referenced and may be **NULL**.

13: **pdvr** – Integer *Input*

*On entry:* the stride separating row or column elements (depending on the value of **order**) in the array **vr**.

*Constraints:*

```
if order = Nag_ColMajor,
    if side = Nag_RightSide or Nag_BothSides, pdvr  $\geq n$ ;
    if side = Nag_LeftSide, vr may be NULL.;
if order = Nag_RowMajor,
    if side = Nag_RightSide or Nag_BothSides, pdvr  $\geq mm$ ;
    if side = Nag_LeftSide, vr may be NULL.;
```

14: **mm** – Integer *Input*

*On entry:* the number of columns in the arrays **vl** and/or **vr**.

*Constraints:*

```
if how_many = Nag_ComputeAll or Nag_BackTransform, mm  $\geq n$ ;
if how_many = Nag_ComputeSelected, mm must not be less than the number of requested
eigenvectors.
```

15: **m** – Integer \* *Output*

*On exit:* the number of columns in the arrays **vl** and/or **vr** actually used to store the eigenvectors.  
If **how\_many** = Nag\_ComputeAll or Nag\_BackTransform, **m** is set to **n**. Each selected real eigenvector occupies one row or column and each selected complex eigenvector occupies two rows or columns.

16: **fail** – NagError \* *Input/Output*

The NAG error argument (see Section 3.6 in the Essential Introduction).

## 6 Error Indicators and Warnings

### NE\_ALLOC\_FAIL

Dynamic memory allocation failed.

See Section 3.2.1.2 in the Essential Introduction for further information.

### NE\_BAD\_PARAM

On entry, argument  $\langle value \rangle$  had an illegal value.

### NE\_CONSTRAINT

On entry, **how\_many** =  $\langle value \rangle$  and **select**[ $j$ ] =  $\langle value \rangle$ .

Constraint: if **how\_many** = Nag\_ComputeSelected, **select**[ $j$ ] = Nag\_TRUE or Nag\_FALSE, for  
 $j = 0, 1, \dots, n - 1$ .

### NE\_ENUM\_INT\_2

On entry, **how\_many** =  $\langle value \rangle$ , **n** =  $\langle value \rangle$  and **mm** =  $\langle value \rangle$ .

Constraint: if **how\_many** = Nag\_ComputeAll or Nag\_BackTransform, **mm**  $\geq n$ ;

if **how\_many** = Nag\_ComputeSelected, **mm** must not be less than the number of requested  
eigenvectors.

On entry, **side** =  $\langle value \rangle$ , **pdvl** =  $\langle value \rangle$ , **mm** =  $\langle value \rangle$ .

Constraint: if **side** = Nag\_LeftSide or Nag\_BothSides, **pdvl**  $\geq mm$ .

On entry, **side** =  $\langle value \rangle$ , **pdvl** =  $\langle value \rangle$  and **n** =  $\langle value \rangle$ .

Constraint: if **side** = Nag\_LeftSide or Nag\_BothSides, **pdvl**  $\geq n$ .

On entry, **side** =  $\langle value \rangle$ , **pdvr** =  $\langle value \rangle$ , **mm** =  $\langle value \rangle$ .

Constraint: if **side** = Nag\_RightSide or Nag\_BothSides, **pdvr**  $\geq$  **mm**.

On entry, **side** =  $\langle value \rangle$ , **pdvr** =  $\langle value \rangle$  and **n** =  $\langle value \rangle$ .

Constraint: if **side** = Nag\_RightSide or Nag\_BothSides, **pdvr**  $\geq$  **n**.

### **NE\_INT**

On entry, **n** =  $\langle value \rangle$ .

Constraint: **n**  $\geq$  0.

On entry, **pda** =  $\langle value \rangle$ .

Constraint: **pda** > 0.

On entry, **pdb** =  $\langle value \rangle$ .

Constraint: **pdb** > 0.

On entry, **pdvl** =  $\langle value \rangle$ .

Constraint: **pdvl** > 0.

On entry, **pdvr** =  $\langle value \rangle$ .

Constraint: **pdvr** > 0.

### **NE\_INT\_2**

On entry, **pda** =  $\langle value \rangle$  and **n** =  $\langle value \rangle$ .

Constraint: **pda**  $\geq$  max(1, **n**).

On entry, **pdb** =  $\langle value \rangle$  and **n** =  $\langle value \rangle$ .

Constraint: **pdb**  $\geq$  max(1, **n**).

### **NE\_INTERNAL\_ERROR**

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.

See Section 3.6.6 in the Essential Introduction for further information.

### **NE\_NO\_LICENCE**

Your licence key may have expired or may not have been installed correctly.

See Section 3.6.5 in the Essential Introduction for further information.

### **NE\_NOT\_COMPLEX**

The 2 by 2 block ( $\langle value \rangle : \langle value \rangle + 1$ ) does not have complex eigenvalues.

## 7 Accuracy

It is beyond the scope of this manual to summarise the accuracy of the solution of the generalized eigenvalue problem. Interested readers should consult Section 4.11 of the LAPACK Users' Guide (see Anderson *et al.* (1999)) and Chapter 6 of Stewart and Sun (1990).

## 8 Parallelism and Performance

`nag_dtgevc` (f08ykc) is not threaded by NAG in any implementation.

`nag_dtgevc` (f08ykc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

## 9 Further Comments

`nag_dtgevc` (f08ykc) is the sixth step in the solution of the real generalized eigenvalue problem and is called after `nag_dhgeqz` (f08xec).

The complex analogue of this function is `nag_ztgevc` (f08yxc).

## 10 Example

This example computes the  $\alpha$  and  $\beta$  arguments, which defines the generalized eigenvalues and the corresponding left and right eigenvectors, of the matrix pair  $(A, B)$  given by

$$A = \begin{pmatrix} 1.0 & 1.0 & 1.0 & 1.0 & 1.0 \\ 2.0 & 4.0 & 8.0 & 16.0 & 32.0 \\ 3.0 & 9.0 & 27.0 & 81.0 & 243.0 \\ 4.0 & 16.0 & 64.0 & 256.0 & 1024.0 \\ 5.0 & 25.0 & 125.0 & 625.0 & 3125.0 \end{pmatrix} \quad \text{and} \quad B = \begin{pmatrix} 1.0 & 2.0 & 3.0 & 4.0 & 5.0 \\ 1.0 & 4.0 & 9.0 & 16.0 & 25.0 \\ 1.0 & 8.0 & 27.0 & 64.0 & 125.0 \\ 1.0 & 16.0 & 81.0 & 256.0 & 625.0 \\ 1.0 & 32.0 & 243.0 & 1024.0 & 3125.0 \end{pmatrix}.$$

To compute generalized eigenvalues, it is required to call five functions: `nag_dggbal` (f08whc) to balance the matrix, `nag_dgeqrf` (f08aec) to perform the  $QR$  factorization of  $B$ , `nag_dormqr` (f08agc) to apply  $Q$  to  $A$ , `nag_dgghrd` (f08wec) to reduce the matrix pair to the generalized Hessenberg form and `nag_dhgeqz` (f08xec) to compute the eigenvalues via the  $QZ$  algorithm.

The computation of generalized eigenvectors is done by calling `nag_dtgevc` (f08ykc) to compute the eigenvectors of the balanced matrix pair. The function `nag_dggbak` (f08wjc) is called to backward transform the eigenvectors to the user-supplied matrix pair. If both left and right eigenvectors are required then `nag_dggbak` (f08wjc) must be called twice.
