

## NAG Library Function Document

### nag\_regsn\_mult\_linear\_tran\_model (g02dkc)

#### 1 Purpose

nag\_regsn\_mult\_linear\_tran\_model (g02dkc) calculates the estimates of the arguments of a general linear regression model for given constraints from the singular value decomposition results.

#### 2 Specification

```
#include <nag.h>
#include <nagg02.h>

void nag_regsn_mult_linear_tran_model (Integer ip, Integer iconst,
    const double p[], const double c[], Integer tdc, double b[], double rss,
    double df, double se[], double cov[], NagError *fail)
```

#### 3 Description

nag\_regsn\_mult\_linear\_tran\_model (g02dkc) computes the estimates given a set of linear constraints for a general linear regression model which is not of full rank. It is intended for use after a call to nag\_regsn\_mult\_linear (g02dac) or nag\_regsn\_mult\_linear\_upd\_model (g02ddc).

In the case of a model not of full rank the functions use a singular value decomposition (SVD) to find the parameter estimates,  $\hat{\beta}_{svd}$ , and their variance-covariance matrix. Details of the SVD are made available, in the form of the matrix  $P^*$ :

$$P^* = \begin{pmatrix} D^{-1}P_1^T \\ P_0^T \end{pmatrix}$$

as described by nag\_regsn\_mult\_linear (g02dac) and nag\_regsn\_mult\_linear\_upd\_model (g02ddc).

Alternative solutions can be formed by imposing constraints on the arguments. If there are  $p$  arguments and the rank of the model is  $k$ , then  $n_c = p - k$  constraints will have to be imposed to obtain a unique solution.

Let  $C$  be a  $p$  by  $n_c$  matrix of constraints, such that

$$C^T \beta = 0,$$

then the new parameter estimates  $\hat{\beta}_c$  are given by:

$$\begin{aligned} \hat{\beta}_c &= A \hat{\beta}_{svd} \\ &= \left( I - P_0 (C^T P_0)^{-1} \right) \hat{\beta}_{svd}, \end{aligned}$$

where  $I$  is the identity matrix, and the variance-covariance matrix is given by:

$$A P_1 D^{-2} P_1^T A^T$$

provided  $(C^T P_0)^{-1}$  exists.

## 5 Arguments

- 1: **ip** – Integer *Input*  
*On entry:* the number of terms in the linear model,  $p$ .  
*Constraint:*  $\mathbf{ip} \geq 1$ .
  
- 2: **iconst** – Integer *Input*  
*On entry:* the number of constraints to be imposed on the arguments,  $n_c$ .  
*Constraint:*  $0 < \mathbf{iconst} < \mathbf{ip}$ .
  
- 3: **p[ip × ip + 2 × ip]** – const double *Input*  
*On entry:* **p** as returned by `nag_regsn_mult_linear (g02dac)` and `nag_regsn_mult_linear_upd_model (g02ddc)`.
  
- 4: **c[ip × tdc]** – const double *Input*  
**Note:** the  $(i, j)$ th element of the matrix  $C$  is stored in  $\mathbf{c}[(i - 1) \times \mathbf{tdc} + j - 1]$ .  
*On entry:* the **iconst** constraints stored by column, i.e., the  $i$ th constraint is stored in the  $i$ th column of **c**.
  
- 5: **tdc** – Integer *Input*  
*On entry:* the stride separating matrix column elements in the array **c**.  
*Constraint:*  $\mathbf{tdc} \geq \mathbf{iconst}$ .
  
- 6: **b[ip]** – double *Input/Output*  
*On entry:* the parameter estimates computed by using the singular value decomposition,  $\hat{\beta}_{svd}$ .  
*On exit:* the parameter estimates of the arguments with the constraints imposed,  $\hat{\beta}_c$ .
  
- 7: **rss** – double *Input*  
*On entry:* the residual sum of squares as returned by `nag_regsn_mult_linear (g02dac)` or `nag_regsn_mult_linear_upd_model (g02ddc)`.  
*Constraint:*  $\mathbf{rss} > 0.0$ .
  
- 8: **df** – double *Input*  
*On entry:* the degrees of freedom associated with the residual sum of squares as returned by `nag_regsn_mult_linear (g02dac)` or `nag_regsn_mult_linear_upd_model (g02ddc)`.  
*Constraint:*  $\mathbf{df} > 0.0$ .
  
- 9: **se[ip]** – double *Output*  
*On exit:* the standard error of the parameter estimates in **b**.

10: **cov**[ $\mathbf{ip} \times (\mathbf{ip} + 1)/2$ ] – double

*Output*

*On exit:* the upper triangular part of the variance-covariance matrix of the **ip** parameter estimates given in **b**. They are stored packed by column, i.e., the covariance between the parameter estimate given in **b**[*i*] and the parameter estimate given in **b**[*j*],  $j \geq i$ , is stored in **cov**[ $j(j + 1)/2 + i$ ], for  $i = 0, 1, \dots, \mathbf{ip} - 1$  and  $j = i, \dots, \mathbf{ip} - 1$ .

11: **fail** – NagError \*

*Input/Output*

The NAG error argument (see Section 3.6 in the Essential Introduction).

## 6 Error Indicators and Warnings

### NE\_2\_INT\_ARG\_GE

On entry, **iconst** =  $\langle value \rangle$  while **ip** =  $\langle value \rangle$ . These arguments must satisfy **iconst** < **ip**.

### NE\_2\_INT\_ARG\_LT

On entry, **tdc** =  $\langle value \rangle$  while **iconst** =  $\langle value \rangle$ . These arguments must satisfy **tdc**  $\geq$  **iconst**.

### NE\_ALLOC\_FAIL

Dynamic memory allocation failed.

### NE\_INT\_ARG\_LE

On entry, **iconst** =  $\langle value \rangle$ .

Constraint: **iconst** > 0.

### NE\_INT\_ARG\_LT

On entry, **ip** =  $\langle value \rangle$ .

Constraint: **ip**  $\geq$  1.

### NE\_MAT\_NOT\_FULL\_RANK

Matrix **c** does not give a model of full rank.

### NE\_REAL\_ARG\_LE

On entry, **df** must not be less than or equal to 0.0: **df** =  $\langle value \rangle$ .

On entry, **rss** must not be less than or equal to 0.0: **rss** =  $\langle value \rangle$ .

## 7 Accuracy

It should be noted that due to rounding errors an argument that should be zero when the constraints have been imposed may be returned as a value of order *machine precision*.

## 8 Parallelism and Performance

Not applicable.

## 9 Further Comments

nag\_regn\_mult\_linear\_tran\_model (g02dkc) is intended for use in situations in which dummy (0-1) variables have been used such as in the analysis of designed experiments when you do not wish to change the arguments of the model to give a full rank model. The function is not intended for situations in which the relationships between the independent variables are only approximate.

## 10 Example

Data from an experiment with four treatments and three observations per treatment are read in. A model, including the mean term, is fitted by `nag_regsn_mult_linear` (g02dac) and the results printed. The constraint that the sum of treatment effects is zero is then read in and the parameter estimates with this constraint imposed are computed by `nag_regsn_mult_linear_tran_model` (g02dkc) and printed.
