

NAG Library Function Document

nag_rand_exp_smooth (g05pmc)

1 Purpose

nag_rand_exp_smooth (g05pmc) simulates from an exponential smoothing model, where the model uses either single exponential, double exponential or a Holt–Winters method.

2 Specification

```
#include <nag.h>
#include <nagg05.h>

void nag_rand_exp_smooth (Nag_InitialValues mode, Integer n,
    Nag_ExpSmoothType itype, Integer p, const double param[],
    const double init[], double var, double r[], Integer state[],
    const double e[], Integer en, double x[], NagError *fail)
```

3 Description

nag_rand_exp_smooth (g05pmc) returns $\{x_t : t = 1, 2, \dots, n\}$, a realization of a time series from an exponential smoothing model defined by one of five smoothing functions:

Single Exponential Smoothing

$$\begin{aligned}x_t &= m_{t-1} + \epsilon_t \\m_t &= \alpha x_t + (1 - \alpha)m_{t-1}\end{aligned}$$

Brown Double Exponential Smoothing

$$\begin{aligned}x_t &= m_{t-1} + \frac{r_{t-1}}{\alpha} + \epsilon_t \\m_t &= \alpha x_t + (1 - \alpha)m_{t-1} \\r_t &= \alpha(m_t - m_{t-1}) + (1 - \alpha)r_{t-1}\end{aligned}$$

Linear Holt Exponential Smoothing

$$\begin{aligned}x_t &= m_{t-1} + \phi r_{t-1} + \epsilon_t \\m_t &= \alpha x_t + (1 - \alpha)(m_{t-1} + \phi r_{t-1}) \\r_t &= \gamma(m_t - m_{t-1}) + (1 - \gamma)\phi r_{t-1}\end{aligned}$$

Additive Holt–Winters Smoothing

$$\begin{aligned}x_t &= m_{t-1} + \phi r_{t-1} + s_{t-1-p} + \epsilon_t \\m_t &= \alpha(x_t - s_{t-p}) + (1 - \alpha)(m_{t-1} + \phi r_{t-1}) \\r_t &= \gamma(m_t - m_{t-1}) + (1 - \gamma)\phi r_{t-1} \\s_t &= \beta(x_t - m_t) + (1 - \beta)s_{t-p}\end{aligned}$$

Multiplicative Holt–Winters Smoothing

$$\begin{aligned}x_t &= (m_{t-1} + \phi r_{t-1}) \times s_{t-1-p} + \epsilon_t \\m_t &= \alpha x_t / s_{t-p} + (1 - \alpha)(m_{t-1} + \phi r_{t-1}) \\r_t &= \gamma(m_t - m_{t-1}) + (1 - \gamma)\phi r_{t-1} \\s_t &= \beta x_t / m_t + (1 - \beta)s_{t-p}\end{aligned}$$

where m_t is the mean, r_t is the trend and s_t is the seasonal component at time t with p being the seasonal order. The errors, ϵ_t are either drawn from a normal distribution with mean zero and variance σ^2 or randomly sampled, with replacement, from a user-supplied vector.

5 Arguments

- 1: **mode** – Nag_InitialValues *Input*
On entry: indicates if nag_rand_exp_smooth (g05pmc) is continuing from a previous call or, if not, how the initial values are computed.
mode = Nag_InitialValuesSupplied
 Values for m_0 , r_0 and s_{-j} , for $j = 0, 1, \dots, p - 1$, are supplied in **init**.
mode = Nag_ContinueNoUpdate
 nag_rand_exp_smooth (g05pmc) continues from a previous call using values that are supplied in **r**. **r** is not updated.
mode = Nag_ContinueAndUpdate
 nag_rand_exp_smooth (g05pmc) continues from a previous call using values that are supplied in **r**. **r** is updated.
Constraint: **mode** = Nag_InitialValuesSupplied, Nag_ContinueNoUpdate or Nag_ContinueAndUpdate.
- 2: **n** – Integer *Input*
On entry: the number of terms of the time series being generated.
Constraint: $n \geq 0$.
- 3: **itype** – Nag_ExpSmoothType *Input*
On entry: the smoothing function.
itype = Nag_SingleExponential
 Single exponential.
itype = Nag_BrownsExponential
 Brown's double exponential.
itype = Nag_LinearHolt
 Linear Holt.
itype = Nag_AdditiveHoltWinters
 Additive Holt–Winters.
itype = Nag_MultiplicativeHoltWinters
 Multiplicative Holt–Winters.
Constraint: **itype** = Nag_SingleExponential, Nag_BrownsExponential, Nag_LinearHolt, Nag_AdditiveHoltWinters or Nag_MultiplicativeHoltWinters.
- 4: **p** – Integer *Input*
On entry: if **itype** = Nag_AdditiveHoltWinters or Nag_MultiplicativeHoltWinters, the seasonal order, p , otherwise **p** is not referenced.
Constraint: if **itype** = Nag_AdditiveHoltWinters or Nag_MultiplicativeHoltWinters, $p > 1$.
- 5: **param**[*dim*] – const double *Input*
Note: the dimension, *dim*, of the array **param** must be at least
 1 when **itype** = Nag_SingleExponential or Nag_BrownsExponential;
 3 when **itype** = Nag_LinearHolt;
 4 when **itype** = Nag_AdditiveHoltWinters or Nag_MultiplicativeHoltWinters.
On entry: the smoothing parameters.
 If **itype** = Nag_SingleExponential or Nag_BrownsExponential, **param**[0] = α and any remaining elements of **param** are not referenced.

If **itype** = Nag_LinearHolt, **param**[0] = α , **param**[1] = γ , **param**[2] = ϕ and any remaining elements of **param** are not referenced.

If **itype** = Nag_AdditiveHoltWinters or Nag_MultiplicativeHoltWinters, **param**[0] = α , **param**[1] = γ , **param**[2] = β and **param**[3] = ϕ and any remaining elements of **param** are not referenced.

Constraints:

if **itype** = Nag_SingleExponential, $0.0 \leq \alpha \leq 1.0$;
 if **itype** = Nag_BrownsExponential, $0.0 < \alpha \leq 1.0$;
 if **itype** = Nag_LinearHolt, $0.0 \leq \alpha \leq 1.0$ and $0.0 \leq \gamma \leq 1.0$ and $\phi \geq 0.0$;
 if **itype** = Nag_AdditiveHoltWinters or Nag_MultiplicativeHoltWinters, $0.0 \leq \alpha \leq 1.0$ and $0.0 \leq \gamma \leq 1.0$ and $0.0 \leq \beta \leq 1.0$ and $\phi \geq 0.0$.

6: **init**[*dim*] – const double *Input*

Note: the dimension, *dim*, of the array **init** must be at least

1 when **itype** = Nag_SingleExponential;
 2 when **itype** = Nag_BrownsExponential or Nag_LinearHolt;
 2 + **p** when **itype** = Nag_AdditiveHoltWinters or Nag_MultiplicativeHoltWinters.

On entry: if **mode** = Nag_InitialValuesSupplied, the initial values for m_0 , r_0 and s_{-j} , for $j = 0, 1, \dots, p-1$, used to initialize the smoothing.

If **itype** = Nag_SingleExponential, **init**[0] = m_0 and any remaining elements of **init** are not referenced.

If **itype** = Nag_BrownsExponential or Nag_LinearHolt, **init**[0] = m_0 and **init**[1] = r_0 and any remaining elements of **init** are not referenced.

If **itype** = Nag_AdditiveHoltWinters or Nag_MultiplicativeHoltWinters, **init**[0] = m_0 , **init**[1] = r_0 and **init**[2] to **init**[2 + $p-1$] hold the values for s_{-j} , for $j = 0, 1, \dots, p-1$. Any remaining elements of **init** are not referenced.

7: **var** – double *Input*

On entry: the variance, σ^2 of the Normal distribution used to generate the errors ϵ_i . If **var** ≤ 0.0 then Normally distributed errors are not used.

8: **r**[*dim*] – double *Input/Output*

Note: the dimension, *dim*, of the array **r** must be at least

13 when **itype** = Nag_SingleExponential, Nag_BrownsExponential or Nag_LinearHolt;
 13 + **p** when **itype** = Nag_AdditiveHoltWinters or Nag_MultiplicativeHoltWinters.

On entry: if **mode** = Nag_ContinueNoUpdate or Nag_ContinueAndUpdate, **r** must contain the values as returned by a previous call to nag_rand_exp_smooth (g05pmc), **r** need not be set otherwise.

On exit: if **mode** = Nag_ContinueNoUpdate, **r** is unchanged. Otherwise, **r** contains the information on the current state of smoothing.

Constraint: if **mode** = Nag_ContinueNoUpdate or Nag_ContinueAndUpdate, **r** must have been initialized by at least one call to nag_rand_exp_smooth (g05pmc) or nag_tsa_exp_smooth (g13amc) with **mode** \neq Nag_ContinueNoUpdate, and **r** must not have been changed since that call.

9: **state**[*dim*] – Integer *Communication Array*

Note: the dimension, *dim*, of this array is dictated by the requirements of associated functions that must have been previously called. This array MUST be the same array passed as argument **state** in the previous call to nag_rand_init_repeatable (g05kfc) or nag_rand_init_nonrepeatable (g05kgc).

On entry: contains information on the selected base generator and its current state.

On exit: contains updated information on the state of the generator.

- 10: **e[en]** – const double *Input*
On entry: if **en** > 0 and **var** ≤ 0.0, a vector from which the errors, ϵ_t are randomly drawn, with replacement.
 If **en** ≤ 0, **e** is not referenced.
- 11: **en** – Integer *Input*
On entry: if **en** > 0, then the length of the vector **e**.
 If both **var** ≤ 0.0 and **en** ≤ 0 then $\epsilon_t = 0.0$, for $t = 1, 2, \dots, n$.
- 12: **x[n]** – double *Output*
On exit: the generated time series, x_t , for $t = 1, 2, \dots, n$.
- 13: **fail** – NagError * *Input/Output*
 The NAG error argument (see Section 3.6 in the Essential Introduction).

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.
 See Section 3.2.1.2 in the Essential Introduction for further information.

NE_BAD_PARAM

On entry, argument $\langle value \rangle$ had an illegal value.

NE_ENUM_INT

On entry, **itype** = $\langle value \rangle$ and **p** = $\langle value \rangle$.
 Constraint: if **itype** = Nag_AdditiveHoltWinters or Nag_MultiplicativeHoltWinters, **p** > 1.
 On entry, **p** = $\langle value \rangle$.
 Constraint: if **itype** = Nag_AdditiveHoltWinters or Nag_MultiplicativeHoltWinters, **p** ≥ 2.

NE_INT

On entry, **n** = $\langle value \rangle$.
 Constraint: **n** ≥ 0.

NE_INT_ARRAY

On entry, some of the elements of the array **r** have been corrupted or have not been initialized.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.
 See Section 3.6.6 in the Essential Introduction for further information.

NE_INVALID_STATE

On entry, **state** vector has been corrupted or not initialized.

NE_NO_LICENCE

Your licence key may have expired or may not have been installed correctly.
See Section 3.6.5 in the Essential Introduction for further information.

NE_REAL_ARRAY

Model unsuitable for multiplicative Holt–Winter, try a different set of parameters.

On entry, **param**[*value*] = *value*.
Constraint: $0 \leq \mathbf{param}[i] \leq 1$.

On entry, **param**[*value*] = *value*.
Constraint: if **itype** = Nag_BrownsExponential, $0 < \mathbf{param}[i] \leq 1$.

On entry, **param**[*value*] = *value*.
Constraint: $\mathbf{param}[i] \geq 0$.

7 Accuracy

Not applicable.

8 Parallelism and Performance

nag_rand_exp_smooth (g05pmc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

Please consult the X06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

None.

10 Example

This example reads 11 observations from a time series relating to the rate of the earth's rotation about its polar axis and fits an exponential smoothing model using nag_tsa_exp_smooth (g13amc).

nag_rand_exp_smooth (g05pmc) is then called multiple times to obtain simulated forecast confidence intervals.
