

NAG Library Function Document

nag_order_data (g10zac)

1 Purpose

nag_order_data (g10zac) orders and weights data which is entered unsequentially, weighted or unweighted.

2 Specification

```
#include <nag.h>
#include <nagg10.h>
void nag_order_data (Integer n, const double x[], const double y[],
                     const double weights[], Integer *nord, double xord[], double yord[],
                     double wwt[], double *rss, NagError *fail)
```

3 Description

Given a set of observations (x_i, y_i) for $i = 1, 2, \dots, n$, with corresponding weights w_i , nag_order_data (g10zac) rearranges the observations so that the x_i are in ascending order.

For any equal x_i in the ordered set, say $x_j = x_{j+1} = \dots = x_{j+k}$, a single observation x_j is returned with a corresponding y' and w' , calculated as:

$$w' = \sum_{l=0}^k w_{i+l}$$

and

$$y' = \frac{\sum_{l=0}^k w_{i+l} y_{i+l}}{w'}.$$

Observations with zero weight are ignored. If no weights are supplied by you, then unit weights are assumed; that is $w_i = 1$, for $i = 1, 2, \dots, n$.

In addition, the within group sum of squares is computed for the tied observations using West's algorithm (see West (1979)).

5 Arguments

- | | |
|---|--------------|
| 1: n – Integer | <i>Input</i> |
| On entry: the number of observations, n . | |
| Constraint: $n \geq 1$. | |
| 2: x[n] – const double | <i>Input</i> |
| On entry: the values x_i , for $i = 1, 2, \dots, n$. | |

3:	y[n] – const double	<i>Input</i>
<i>On entry:</i> the values y_i , for $i = 1, 2, \dots, n$.		
4:	weights[n] – const double	<i>Input</i>
<i>On entry:</i> weights must contain the n weights, if they are required. Otherwise, weights must be set to NULL .		
<i>Constraints:</i>		
if weights are required, then weights [$i - 1$] ≥ 0.0 , for $i = 1, 2, \dots, n$; at least one weights [$i - 1$] > 0.0 , for some i .		
5:	nord – Integer *	<i>Output</i>
<i>On exit:</i> the number of distinct observations.		
6:	xord[n] – double	<i>Output</i>
<i>On exit:</i> the first nord elements contain the ordered and distinct x_i .		
7:	yord[n] – double	<i>Output</i>
<i>On exit:</i> the first nord elements contain the values y' corresponding to the values in xord .		
8:	wwt[n] – double	<i>Output</i>
<i>On exit:</i> the first nord elements contain the values w' corresponding to the values of xord and yord .		
9:	rss – double *	<i>Output</i>
<i>On exit:</i> the within group sum of squares for tied observations.		
10:	fail – NagError *	<i>Input/Output</i>
The NAG error argument (see Section 3.6 in the Essential Introduction).		

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.

NE_ARRAY_CONS

The contents of array **weights** are not valid.
Constraint: at least one element of **weights** must be > 0 .

NE_INT_ARG_LT

On entry, **n** = $\langle value \rangle$.
Constraint: **n** ≥ 1 .

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

NE_REAL_ARRAY_CONS

On entry, **weights**[$\langle value \rangle$] = $\langle value \rangle$.
Constraint: **weights**[i] ≥ 0 , for $i = 0, 1, \dots, n - 1$.

7 Accuracy

For a discussion on the accuracy of the algorithm for computing mean and variance see West (1979).

8 Parallelism and Performance

Not applicable.

9 Further Comments

nag_order_data (g10zac) may be used to compute the pure error sum of squares in simple linear regression along with nag_regn_mult_linear (g02dac), see Draper and Smith (1985).

10 Example

A set of unweighted observations are input and nag_order_data (g10zac) used to produce a set of strictly increasing weighted observations.
