

NAG Library Function Document

nag_kalman_sqrt_filt_info_invar (g13edc)

1 Purpose

nag_kalman_sqrt_filt_info_invar (g13edc) performs a combined measurement and time update of one iteration of the time-invariant Kalman filter. The method employed for this update is the square root information filter with the system matrices in condensed controller Hessenberg form.

2 Specification

```
#include <nag.h>
#include <nagg13.h>

void nag_kalman_sqrt_filt_info_invar (Integer n, Integer m, Integer p,
                                     double t[], Integer tdt, const double ainv[], Integer tda,
                                     const double ainvb[], Integer tda1, const double rinv[], Integer tdr,
                                     const double c[], Integer tdc, const double qinv[], Integer tdq,
                                     double x[], const double rinv[], const double z[], double tol,
                                     NagError *fail)
```

3 Description

For the state space system defined by

$$\begin{aligned} X_{i+1} &= AX_i + BW_i & \text{var}(W_i) = Q_i \\ Y_i &= CX_i + V_i & \text{var}(V_i) = R_i \end{aligned}$$

the estimate of X_i given observations Y_1 to Y_{i-1} is denoted by $\hat{X}_{i|i-1}$ with $\text{var}(\hat{X}_{i|i-1}) = P_{i|i-1} = S_i S_i^T$ (where A , B and C are time invariant). The function performs one recursion of the square root information filter algorithm, summarised as follows:

$$U_1 \begin{pmatrix} Q_i^{-1/2} & 0 & Q_i^{-1/2} \bar{w} \\ 0 & R_i^{-1/2} C & R_i^{-1/2} Y_{i+1} \\ S_i^{-1} A^{-1} B & S_i^{-1} A^{-1} & S_i^{-1} X_{i|i} \end{pmatrix} \quad \begin{array}{l} \text{(Pre-array)} \\ = \\ \text{(Post-array)} \end{array} \begin{pmatrix} F_{i+1}^{-1/2} & * & * \\ 0 & S_{i+1}^{-1} & \xi_{i+1|i+1} \\ 0 & 0 & E_{i+1} \end{pmatrix}$$

where U_1 is an orthogonal transformation triangularizing the pre-array, and the matrix pair $(A^{-1}, A^{-1}B)$ is in upper controller Hessenberg form. The triangularization is done entirely via Householder transformations exploiting the zero pattern of the pre-array. An example of the pre-array is given below (where $n = 6$, $m = 2$ and $p = 3$):

$$\left(\begin{array}{ccc|cccc} x & x & & & & & x \\ & x & & & & & x \\ & & x & & & & x \\ \hline x & x & x & x & x & x & x \\ & x & x & x & x & x & x \\ & & x & x & x & x & x \\ \hline & & & x & x & x & x \\ \hline & & & x & x & x & x \\ \hline & & & x & x & x & x \end{array} \right)$$

The term \bar{w} is the mean process noise, and E_{i+1} is the estimated error at instant $i + 1$. The inverse of the state covariance matrix $P_{i|i}$ is factored as follows

$$P_{i|i}^{-1} = (S_i^{-1})^T S_i^{-1}$$

where $P_{i|i} = S_i S_i^T$ (S_i is lower). The new state filtered state estimate is computed via

$$\hat{X}_{i+1|i+1} = S_{i+1}^{-1} \xi_{i+1|i+1}$$

The function returns S_{i+1}^{-1} and, optionally, $\hat{X}_{i+1|i+1}$ (see the Introduction to Chapter g13 for more information concerning the information filter).

5 Arguments

- | | | |
|----|--|---------------------|
| 1: | n – Integer | <i>Input</i> |
| | <i>On entry:</i> the actual state dimension, n , i.e., the order of the matrices S_i^{-1} and A^{-1} . | |
| | <i>Constraint:</i> $\mathbf{n} \geq 1$. | |
| 2: | m – Integer | <i>Input</i> |
| | <i>On entry:</i> the actual input dimension, m , i.e., the order of the matrix $Q_i^{-1/2}$. | |
| | <i>Constraint:</i> $\mathbf{m} \geq 1$. | |
| 3: | p – Integer | <i>Input</i> |
| | <i>On entry:</i> The actual output dimension, p , i.e., the order of the matrix $R_i^{-1/2}$. | |
| | <i>Constraint:</i> $\mathbf{p} \geq 1$. | |
| 4: | t[n × tdt] – double | <i>Input/Output</i> |
| | Note: the (i, j) th element of the matrix T is stored in $\mathbf{t}[(i - 1) \times \mathbf{tdt} + j - 1]$. | |
| | <i>On entry:</i> the leading n by n upper triangular part of this array must contain S_i^{-1} the square root of the inverse of the state covariance matrix $P_{i i}$. | |
| | <i>On exit:</i> the leading n by n upper triangular part of this array contains S_{i+1}^{-1} , the square root of the inverse of the state covariance matrix $P_{i+1 i+1}$. | |
| 5: | tdt – Integer | <i>Input</i> |
| | <i>On entry:</i> the stride separating matrix column elements in the array t . | |
| | <i>Constraint:</i> $\mathbf{tdt} \geq \mathbf{n}$. | |
| 6: | ainv[n × tda] – const double | <i>Input</i> |
| | Note: the (i, j) th element of the matrix is stored in $\mathbf{ainv}[(i - 1) \times \mathbf{tda} + j - 1]$. | |

On entry: the leading n by n part of this array must contain the upper controller Hessenberg matrix $UA^{-1}U^T$. Where A^{-1} is the inverse of the state transition matrix, and U is the unitary matrix generated by the function nag_trans_hessenberg_controller (g13exc).

7: **tda** – Integer *Input*

On entry: the stride separating matrix column elements in the array **ainv**.

Constraint: $\text{tda} \geq \mathbf{n}$.

8: **ainvb**[$\mathbf{n} \times \text{tdai}$] – const double *Input*

Note: the (i, j) th element of the matrix is stored in **ainvb**[($i - 1$) \times **tdai** + $j - 1$].

On entry: the leading n by m part of this array must contain the upper controller Hessenberg matrix $UA^{-1}B$. Where A^{-1} is the inverse of the transition matrix, B is the input weight matrix B , and U is the unitary transformation generated by the function nag_trans_hessenberg_controller (g13exc).

9: **tdai** – Integer *Input*

On entry: the stride separating matrix column elements in the array **ainvb**.

Constraint: $\text{tdai} \geq \mathbf{m}$.

10: **rinv**[$\mathbf{p} \times \text{tdr}$] – const double *Input*

Note: the (i, j) th element of the matrix is stored in **rinv**[($i - 1$) \times **tdr** + $j - 1$].

On entry: if the noise covariance matrix is to be supplied separately from the output weight matrix, then the leading p by p upper triangular part of this array must contain $R^{-1/2}$ the right Cholesky factor of the inverse of the measurement noise covariance matrix. If this information is not to be input separately from the output weight matrix **c** then the array **rinv** must be set to **NULL**.

11: **tdr** – Integer *Input*

On entry: the stride separating matrix column elements in the array **rinv**.

Constraint: $\text{tdr} \geq \mathbf{p}$ if **rinv** is defined.

12: **c**[$\mathbf{p} \times \text{tdc}$] – const double *Input*

Note: the (i, j) th element of the matrix C is stored in **c**[($i - 1$) \times **tdc** + $j - 1$].

On entry: if the array argument **rinv** (above) has been defined then the leading p by n part of this array must contain the matrix CUT^T , otherwise (if **rinv** is **NULL** then the leading p by n part of the array must contain the matrix $R_i^{-1/2}CUT^T$. C is the output weight matrix, R_i is the noise covariance matrix and U is the same unitary transformation used for defining array arguments **ainv** and **ainvb**.

13: **tdc** – Integer *Input*

On entry: the stride separating matrix column elements in the array **c**.

Constraint: $\text{tdc} \geq \mathbf{n}$.

14: **qinv**[$\mathbf{m} \times \text{tdq}$] – const double *Input*

Note: the (i, j) th element of the matrix is stored in **qinv**[($i - 1$) \times **tdq** + $j - 1$].

On entry: the leading m by m upper triangular part of this array must contain $Q_i^{-1/2}$ the right Cholesky factor of the inverse of the process noise covariance matrix.

15:	tdq – Integer	<i>Input</i>
<i>On entry:</i> the stride separating matrix column elements in the array qinv .		
<i>Constraint:</i> $\text{tdq} \geq \text{m}$.		
16:	x[n] – double	<i>Input/Output</i>
<i>On entry:</i> this array must contain the estimated state $\hat{X}_{i i}$		
<i>On exit:</i> this array contains the estimated state $\hat{X}_{i+1 i+1}$.		
17:	rinv[y][p] – const double	<i>Input</i>
<i>On entry:</i> this array must contain $R_i^{-1/2}Y_{i+1}$, the product of the upper triangular matrix $R_i^{-1/2}$ and the measured output vector Y_{i+1} .		
18:	z[m] – const double	<i>Input</i>
<i>On entry:</i> this array must contain \bar{w} , the mean value of the state process noise.		
19:	tol – double	<i>Input</i>
<i>On entry:</i> tol is used to test for near singularity of the matrix S_{i+1} . If you set tol to be less than $n^2 \times \epsilon$ then the tolerance is taken as $n^2 \times \epsilon$, where ϵ is the machine precision .		
20:	fail – NagError *	<i>Input/Output</i>
The NAG error argument (see Section 3.6 in the Essential Introduction).		

6 Error Indicators and Warnings

NE_2_INT_ARG_LT

On entry, **tdt** = $\langle\text{value}\rangle$ while **n** = $\langle\text{value}\rangle$. These arguments must satisfy $\text{tdt} \geq \text{n}$.
 On entry **tda** = $\langle\text{value}\rangle$ while **n** = $\langle\text{value}\rangle$. These arguments must satisfy $\text{tda} \geq \text{n}$.
 On entry **tdai** = $\langle\text{value}\rangle$ while **m** = $\langle\text{value}\rangle$. These arguments must satisfy $\text{tdai} \geq \text{m}$.
 On entry **tdc** = $\langle\text{value}\rangle$ while **n** = $\langle\text{value}\rangle$. These arguments must satisfy $\text{tdc} \geq \text{n}$.
 On entry **tdq** = $\langle\text{value}\rangle$ while **m** = $\langle\text{value}\rangle$. These arguments must satisfy $\text{tdq} \geq \text{m}$.
 On entry **tdr** = $\langle\text{value}\rangle$ while **p** = $\langle\text{value}\rangle$. These arguments must satisfy $\text{tdr} \geq \text{p}$.

NE_ALLOC_FAIL

Dynamic memory allocation failed.

NE_INT_ARG_LT

On entry, **m** = $\langle\text{value}\rangle$.
 Constraint: $\text{m} \geq 1$.
 On entry, **n** = $\langle\text{value}\rangle$.
 Constraint: $\text{n} \geq 1$.
 On entry, **p** = $\langle\text{value}\rangle$.
 Constraint: $\text{p} \geq 1$.

NE_MAT_SINGULAR

The matrix inverse(S) is singular.

7 Accuracy

The use of the square root algorithm improves the stability of the computations.

8 Parallelism and Performance

Not applicable.

9 Further Comments

The algorithm requires approximately $\frac{1}{6}n^3 + n^2(\frac{3}{2}m + p) + 2nm^2 + \frac{2}{3}m^3$ operations and is backward stable (see Verhaegen and van Dooren (1986)).

10 Example

For this function two examples are presented. There is a single example program for nag_kalman_sqrt_filt_info_invar (g13edc), with a main program and the code to solve the two example problems is given in the functions ex1 and ex2.

Example 1 (ex1)

To apply three iterations of the Kalman filter (in square root information form) to the time-invariant system $(A^{-1}, A^{-1}B, C)$ supplied in upper controller Hessenberg form.

Example 2 (ex2)

To apply three iterations of the Kalman filter (in square root information form) to the general time-invariant system $(A^{-1}, A^{-1}B, C)$. The use of the time-varying Kalman function nag_kalman_sqrt_filt_info_var (g13ecc) is compared with that of the time-invariant function nag_kalman_sqrt_filt_info_invar (g13edc). The same original data is used by both functions but additional transformations are required before it can be supplied to nag_kalman_sqrt_filt_info_invar (g13edc). It can be seen that (after the appropriate back-transformations on the output of nag_kalman_sqrt_filt_info_invar (g13edc)) the results of both nag_kalman_sqrt_filt_info_var (g13ecc) and nag_kalman_sqrt_filt_info_invar (g13edc) are in agreement.

10.3 Program Results

```
nag_kalman_sqrt_filt_info_invar (g13edc) Example Program Results
```

Example 1

The inverse of the square root of the state covariance matrix is

-0.8731	-1.1461	-1.0260	-0.8901
0.0000	-0.2763	-0.1929	-0.3763

```
0.0000  0.0000 -0.1110 -0.1051
0.0000  0.0000  0.0000  0.3120
```

The components of the estimated filtered state are

k	x(k)
0	-2.0688
1	-0.7814
2	2.2181
3	0.9298

Example 2

Results from nag_kalman_sqrt_filt_info_var (g13ecc)

The information matrix ig is

```
0.4661  0.5290  0.4826  0.4134
0.5290  0.7196  0.6158  0.5657
0.4826  0.6158  0.5781  0.4776
0.4134  0.5657  0.4776  0.5825
```

The components of the estimated filtered state are

k	x(k)
0	-0.8369
1	-1.4649
2	1.4877
3	1.5276

Results from nag_kalman_sqrt_filt_info_invar (g13edc)

The information matrix ih is

```
0.0399 -0.0805 -0.0137 -0.0174
-0.0805  2.1143  0.2453  0.0406
-0.0137  0.2453  0.0770 -0.0294
-0.0174  0.0406 -0.0294  0.1151
```

The matrix $u' * ih * u$ is

```
0.4661  0.5290  0.4826  0.4134
0.5290  0.7196  0.6158  0.5657
0.4826  0.6158  0.5781  0.4776
0.4134  0.5657  0.4776  0.5825
```

The components of the estimated filtered state are

k	x(k)
0	-0.8369
1	-1.4649
2	1.4877
3	1.5276
