## **NAG Library Function Document**

## nag zero nonlin eqns deriv rcomm (c05rdc)

### 1 Purpose

nag\_zero\_nonlin\_eqns\_deriv\_rcomm (c05rdc) is a comprehensive reverse communication function that finds a solution of a system of nonlinear equations by a modification of the Powell hybrid method. You must provide the Jacobian.

### 2 Specification

### 3 Description

The system of equations is defined as:

$$f_i(x_1, x_2, \dots, x_n) = 0, \quad i = 1, 2, \dots, n.$$

nag\_zero\_nonlin\_eqns\_deriv\_rcomm (c05rdc) is based on the MINPACK routine HYBRJ (see Moré *et al.* (1980)). It chooses the correction at each step as a convex combination of the Newton and scaled gradient directions. The Jacobian is updated by the rank-1 method of Broyden. For more details see Powell (1970).

### 5 Arguments

**Note**: this function uses **reverse communication**. Its use involves an initial entry, intermediate exits and re-entries, and a final exit, as indicated by the argument **irevem**. Between intermediate exits and re-entries, **all arguments other than fvec and fjac must remain unchanged**.

#### 1: **irevcm** – Integer \*

Input/Output

On initial entry: must have the value 0.

On intermediate exit: specifies what action you must take before re-entering nag\_zero\_nonlin\_eqns\_deriv\_rcomm (c05rdc) with irevcm unchanged. The value of irevcm should be interpreted as follows:

#### irevcm = 1

Indicates the start of a new iteration. No action is required by you, but  $\mathbf{x}$  and  $\mathbf{fvec}$  are available for printing.

#### irevcm = 2

Indicates that before re-entry to nag\_zero\_nonlin\_eqns\_deriv\_rcomm (c05rdc), **fvec** must contain the function values  $f_i(x)$ .

irevcm = 3

Indicates that before re-entry to nag\_zero\_nonlin\_eqns\_deriv\_rcomm (c05rdc),  $\mathbf{fjac}[(j-1)\times\mathbf{n}+i-1] \text{ must contain the value of } \frac{\partial f_i}{\partial x_j} \text{ at the point } x, \text{ for } i=1,2,\ldots,n$  and  $j=1,2,\ldots,n$ .

On final exit: irevcm = 0, and the algorithm has terminated.

Constraint: **irevcm** = 0, 1, 2 or 3.

2: **n** – Integer

On entry: n, the number of equations.

Constraint:  $\mathbf{n} > 0$ .

3:  $\mathbf{x}[\mathbf{n}]$  – double Input/Output

On initial entry: an initial guess at the solution vector.

On intermediate exit: contains the current point.

On final exit: the final estimate of the solution vector.

4:  $\mathbf{fvec}[\mathbf{n}] - \mathbf{double}$  Input/Output

On initial entry: need not be set.

On intermediate re-entry: if **irevcm**  $\neq$  2, **fvec** must not be changed.

If irevcm = 2, fvec must be set to the values of the functions computed at the current point x. On final exit: the function values at the final point, x.

5:  $\mathbf{fjac}[\mathbf{n} \times \mathbf{n}]$  - double Input/Output

**Note**: the (i, j)th element of the matrix is stored in  $\mathbf{fjac}[(j-1) \times \mathbf{n} + i - 1]$ .

On initial entry: need not be set.

On intermediate re-entry: if **irevcm**  $\neq$  3, **fjac** must not be changed.

If **irevcm** = 3, **fjac**[ $(j-1) \times \mathbf{n} + i - 1$ ] must contain the value of  $\frac{\partial f_i}{\partial x_j}$  at the point x, for i = 1, 2, ..., n and j = 1, 2, ..., n.

On final exit: the orthogonal matrix Q produced by the QR factorization of the final approximate Jacobian, stored by columns.

6: **xtol** – double *Input* 

On initial entry: the accuracy in  $\mathbf{x}$  to which the solution is required.

Suggested value:  $\sqrt{\epsilon}$ , where  $\epsilon$  is the **machine precision** returned by nag\_machine\_precision (X02AJC).

Constraint:  $xtol \ge 0.0$ .

7: scale\_mode - Nag ScaleType Input

On initial entry: indicates whether or not you have provided scaling factors in diag.

If scale\_mode = Nag\_ScaleProvided the scaling must have been supplied in diag.

Otherwise, if scale\_mode = Nag\_NoScaleProvided, the variables will be scaled internally.

Constraint: scale\_mode = Nag\_NoScaleProvided or Nag\_ScaleProvided.

c05rdc.2 Mark 26

c05rdc

Input

#### 8: diag[n] - double

Input/Output

On initial entry: if **scale\_mode** = Nag\_ScaleProvided, **diag** must contain multiplicative scale factors for the variables.

If scale\_mode = Nag\_NoScaleProvided, diag need not be set.

Constraint: if scale\_mode = Nag\_ScaleProvided, diag[i-1] > 0.0, for i = 1, 2, ..., n.

On intermediate exit: diag must not be changed.

On final exit: the scale factors actually used (computed internally if scale\_mode = Nag\_NoScaleProvided).

9: **factor** – double

On initial entry: a quantity to be used in determining the initial step bound. In most cases, **factor** should lie between 0.1 and 100.0. (The step bound is **factor**  $\times \|\mathbf{diag} \times \mathbf{x}\|_2$  if this is nonzero; otherwise the bound is **factor**.)

Suggested value: factor = 100.0.

Constraint: factor > 0.0.

#### 10: $\mathbf{r}[\mathbf{n} \times (\mathbf{n} + \mathbf{1})/2]$ – double

Input/Output

On initial entry: need not be set.

On intermediate exit: must not be changed.

On final exit: the upper triangular matrix R produced by the QR factorization of the final approximate Jacobian, stored row-wise.

#### 11: qtf[n] – double

Input/Output

On initial entry: need not be set.

On intermediate exit: must not be changed.

On final exit: the vector  $Q^{T}f$ .

### 12: **iwsav**[17] – Integer

Communication Array

13:  $rwsav[4 \times n + 10]$  – double

Communication Array

The arrays **iwsav** and **rwsav** MUST NOT be altered between calls to nag\_zero\_nonlin\_eqns\_der iv rcomm (c05rdc).

### 14: **fail** – NagError \*

Input/Output

The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

## 6 Error Indicators and Warnings

### NE ALLOC FAIL

Dynamic memory allocation failed.

See Section 3.2.1.2 in How to Use the NAG Library and its Documentation for further information.

#### NE BAD PARAM

On entry, argument  $\langle value \rangle$  had an illegal value.

#### **NE DIAG ELEMENTS**

On entry, **scale\_mode** = Nag\_ScaleProvided and **diag** contained a non-positive element.

c05rdc NAG Library Manual

#### NE INT

```
On entry, irevcm = \langle value \rangle.
Constraint: irevcm = 0, 1, 2 or 3.
On entry, n = \langle value \rangle.
Constraint: n > 0.
```

#### NE INTERNAL ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG. See Section 3.6.6 in How to Use the NAG Library and its Documentation for further information.

### NE NO IMPROVEMENT

The iteration is not making good progress, as measured by the improvement from the last  $\langle value \rangle$  iterations. This failure exit may indicate that the system does not have a zero, or that the solution is very close to the origin (see Section 7). Otherwise, rerunning nag\_zero\_nonlin\_eqns\_der iv rcomm (c05rdc) from a different starting point may avoid the region of difficulty.

The iteration is not making good progress, as measured by the improvement from the last  $\langle value \rangle$  Jacobian evaluations. This failure exit may indicate that the system does not have a zero, or that the solution is very close to the origin (see Section 7). Otherwise, rerunning nag\_zero\_nonlin eqns deriv roomm (c05rdc) from a different starting point may avoid the region of difficulty.

## NE\_NO\_LICENCE

Your licence key may have expired or may not have been installed correctly. See Section 3.6.5 in How to Use the NAG Library and its Documentation for further information.

#### NE REAL

```
On entry, factor = \langle value \rangle.
Constraint: factor > 0.0.
On entry, xtol = \langle value \rangle.
Constraint: xtol > 0.0.
```

### NE\_TOO\_SMALL

No further improvement in the solution is possible. **xtol** is too small: **xtol** =  $\langle value \rangle$ .

### 7 Accuracy

If  $\hat{x}$  is the true solution and D denotes the diagonal matrix whose entries are defined by the array **diag**, then nag\_zero\_nonlin\_eqns\_deriv\_rcomm (c05rdc) tries to ensure that

$$||D(x - \hat{x})||_2 \le \mathbf{xtol} \times ||D\hat{x}||_2.$$

If this condition is satisfied with  $xtol = 10^{-k}$ , then the larger components of Dx have k significant decimal digits. There is a danger that the smaller components of Dx may have large relative errors, but the fast rate of convergence of nag\_zero\_nonlin\_eqns\_deriv\_rcomm (c05rdc) usually obviates this possibility.

If **xtol** is less than *machine precision* and the above test is satisfied with the *machine precision* in place of **xtol**, then the function exits with **fail.code** = NE\_TOO\_SMALL.

**Note:** this convergence test is based purely on relative error, and may not indicate convergence if the solution is very close to the origin.

The convergence test assumes that the functions and the Jacobian are coded consistently and that the functions are reasonably well behaved. If these conditions are not satisfied, then nag\_zero\_nonlin\_eqns\_deriv\_rcomm (c05rdc) may incorrectly indicate convergence. The coding of the Jacobian can be

c05rdc.4 Mark 26

checked using nag\_check\_derivs (c05zdc). If the Jacobian is coded correctly, then the validity of the answer can be checked by rerunning nag\_zero\_nonlin\_eqns\_deriv\_rcomm (c05rdc) with a lower value for **xtol**.

#### 8 Parallelism and Performance

nag\_zero\_nonlin\_eqns\_deriv\_rcomm (c05rdc) is threaded by NAG for parallel execution in multi-threaded implementations of the NAG Library.

nag\_zero\_nonlin\_eqns\_deriv\_rcomm (c05rdc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the x06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Notefor your implementation for any additional implementation-specific information.

## 9 Further Comments

The time required by nag\_zero\_nonlin\_eqns\_deriv\_rcomm (c05rdc) to solve a given problem depends on n, the behaviour of the functions, the accuracy requested and the starting point. The number of arithmetic operations executed by nag\_zero\_nonlin\_eqns\_deriv\_rcomm (c05rdc) is approximately  $11.5 \times n^2$  to process each evaluation of the functions and approximately  $1.3 \times n^3$  to process each evaluation of the Jacobian. The timing of nag\_zero\_nonlin\_eqns\_deriv\_rcomm (c05rdc) is strongly influenced by the time spent evaluating the functions.

Ideally the problem should be scaled so that, at the solution, the function values are of comparable magnitude.

## 10 Example

This example determines the values  $x_1, \ldots, x_9$  which satisfy the tridiagonal equations:

$$(3-2x_1)x_1-2x_2 = -1, -x_{i-1} + (3-2x_i)x_i - 2x_{i+1} = -1, i = 2, 3, \dots, 8 -x_8 + (3-2x_9)x_9 = -1.$$
