# NAG Library Function Document <br> nag_sum_fft_hermitian_2d (c06pwc) 

## 1 Purpose

nag_sum_fft_hermitian_2d (c06pwc) computes the two-dimensional inverse discrete Fourier transform of a bivariate Hermitian sequence of complex data values.

## 2 Specification

```
#include <nag.h>
#include <nagc06.h>
void nag_sum_fft_hermitian_2d (Integer m, Integer n, const Complex y[],
    double x[], NagError *fail)
```

## 3 Description

nag_sum_fft_hermitian_2d (c06pwc) computes the two-dimensional inverse discrete Fourier transform of a bivariate Hermitian sequence of complex data values $z_{j_{1} j_{2}}$, for $j_{1}=0,1, \ldots, m-1$ and $j_{2}=0,1, \ldots, n-1$.
The discrete Fourier transform is here defined by

$$
\hat{x}_{k_{1} k_{2}}=\frac{1}{\sqrt{m n}} \sum_{j_{1}=0}^{m-1} \sum_{j_{2}=0}^{n-1} z_{j_{1} j_{2}} \times \exp \left(2 \pi i\left(\frac{j_{1} k_{1}}{m}+\frac{j_{2} k_{2}}{n}\right)\right)
$$

where $k_{1}=0,1, \ldots, m-1$ and $k_{2}=0,1, \ldots, n-1$. (Note the scale factor of $\frac{1}{\sqrt{m n}}$ in this definition.)
Because the input data satisfies conjugate symmetry (i.e., $z_{k_{1} k_{2}}$ is the complex conjugate of $z_{\left(m-k_{1}\right) k_{2}}$, the transformed values $\hat{x}_{k_{1} k_{2}}$ are real.
A call of nag_sum_fft_real_2d (c06pvc) followed by a call of nag_sum_fft_hermitian_2d (c06pwc) will restore the original data.
This function performs multiple one-dimensional discrete Fourier transforms by the fast Fourier transform (FFT) algorithm in Brigham (1974) and Temperton (1983).

## 5 Arguments

1: $\quad \mathbf{m}$ - Integer
Input
On entry: $m$, the first dimension of the transform.
Constraint: $\mathbf{m} \geq 1$.
2: $\quad \mathbf{n}$ - Integer
Input
On entry: $n$, the second dimension of the transform.
Constraint: $\mathbf{n} \geq 1$.

3: $\quad \mathbf{y}[(\mathbf{m} / \mathbf{2}+\mathbf{1}) \times \mathbf{n}]-$ const Complex
Input
On entry: the Hermitian sequence of complex input dataset $z$, where $z_{j_{1} j_{2}}$ is stored in $\mathbf{y}\left[j_{2} \times(m / 2+1)+j_{1}\right]$, for $j_{1}=0,1, \ldots, m / 2$ and $j_{2}=0,1, \ldots, n-1$.

4: $\mathbf{x}[\mathbf{m} \times \mathbf{n}]$ - double Output On exit: the real output dataset $\hat{x}$, where $\hat{x}_{k_{1} k_{2}}$ is stored in $\mathbf{x}\left[k_{2} \times m+k_{1}\right]$, for $k_{1}=0,1, \ldots, m-1$ and $k_{2}=0,1, \ldots, n-1$.

5: fail - NagError * Input/Output The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

## 6 Error Indicators and Warnings

## NE_ALLOC_FAIL

Dynamic memory allocation failed.
See Section 3.2.1.2 in How to Use the NAG Library and its Documentation for further information.

## NE_BAD_PARAM

On entry, argument $\langle v a l u e\rangle$ had an illegal value.

## NE_INT

On entry, $\mathbf{m}=\langle$ value $\rangle$.
Constraint: $\mathbf{m} \geq 1$.
On entry, $\mathbf{n}=\langle$ value $\rangle$.
Constraint: $\mathbf{n} \geq 1$.

## NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.
An unexpected error has been triggered by this function. Please contact NAG.
See Section 3.6.6 in How to Use the NAG Library and its Documentation for further information.

## NE_NO_LICENCE

Your licence key may have expired or may not have been installed correctly.
See Section 3.6.5 in How to Use the NAG Library and its Documentation for further information.

## 7 Accuracy

Some indication of accuracy can be obtained by performing a forward transform using nag_sum_fft_real_2d (c06pvc) and a backward transform using nag_sum_fft_hermitian_2d (c06pwc), and comparing the results with the original sequence (in exact arithmetic they would be identical).

## 8 Parallelism and Performance

nag_sum_fft_hermitian_2d (c06pwc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.
nag_sum_fft_hermitian_2d (c06pwc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the x06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Notefor your implementation for any additional implementation-specific information.

## 9 Further Comments

The time taken by nag_sum_fft_hermitian_2d (c06pwc) is approximately proportional to $m n \log (m n)$, but also depends on the factors of $m$ and $\bar{n}$. nag_sum_fft_hermitian_2d (c06pwc) is fastest if the only prime factors of $m$ and $n$ are 2,3 and 5 , and is particularly slow if $m$ or $n$ is a large prime, or has large prime factors.

Workspace is internally allocated by nag_sum_fft_hermitian_2d (c06pwc). The total size of these arrays is approximately proportional to $m n$.

## 10 Example

See Section 10 in nag_sum_fft_real_2d (c06pvc).
