# **NAG Library Function Document**

# nag pde parab 1d keller ode remesh (d03prc)

# 1 Purpose

nag\_pde\_parab\_ld\_keller\_ode\_remesh (d03prc) integrates a system of linear or nonlinear, first-order, time-dependent partial differential equations (PDEs) in one space variable, with scope for coupled ordinary differential equations (ODEs), and automatic adaptive spatial remeshing. The spatial discretization is performed using the Keller box scheme (see Keller (1970)) and the method of lines is employed to reduce the PDEs to a system of ODEs. The resulting system is solved using a Backward Differentiation Formula (BDF) method or a Theta method (switching between Newton's method and functional iteration).

# 2 Specification

```
#include <nag.h>
#include <nagd03.h>
void nag_pde_parab_ld_keller_ode_remesh (Integer npde, double *ts,

```

# 3 Description

nag\_pde\_parab\_1d\_keller\_ode\_remesh (d03prc) integrates the system of first-order PDEs and coupled ODEs given by the master equations:

$$G_i(x, t, U, U_x, U_t, V, \dot{V}) = 0, \quad i = 1, 2, \dots, \text{npde}, \quad a \le x \le b, t \ge t_0,$$
 (1)

$$R_i(t, V, \dot{V}, \xi, U^*, U_r^*, U_t^*) = 0, \quad i = 1, 2, \dots, ncode.$$
 (2)

In the PDE part of the problem given by (1), the functions  $G_i$  must have the general form

$$G_i = \sum_{i=1}^{\mathbf{npde}} P_{i,j} \frac{\partial U_j}{\partial t} + \sum_{i=1}^{\mathbf{ncode}} Q_{i,j} \dot{V}_j + S_i = 0, \quad i = 1, 2, \dots, \mathbf{npde},$$
(3)

where  $P_{i,j}$ ,  $Q_{i,j}$  and  $S_i$  depend on x, t, U,  $U_x$  and V.

The vector U is the set of PDE solution values

$$U(x,t) = [U_1(x,t), \dots, U_{\mathbf{npde}}(x,t)]^{\mathrm{T}},$$

and the vector  $U_x$  is the partial derivative with respect to x. The vector V is the set of ODE solution values

$$V(t) = \left[V_1(t), \dots, V_{\mathbf{ncode}}(t)\right]^{\mathrm{T}},$$

and  $\dot{V}$  denotes its derivative with respect to time.

In the ODE part given by (2),  $\xi$  represents a vector of  $n_{\xi}$  spatial coupling points at which the ODEs are coupled to the PDEs. These points may or may not be equal to some of the PDE spatial mesh points.  $U^*$ ,  $U^*_x$  and  $U^*_t$  are the functions U,  $U_x$  and  $U_t$  evaluated at these coupling points. Each  $R_i$  may only depend linearly on time derivatives. Hence equation (2) may be written more precisely as

$$R = A - B\dot{V} - CU_t^*,\tag{4}$$

where  $R = [R_1, \dots, R_{\mathbf{ncode}}]^{\mathsf{T}}$ , A is a vector of length  $\mathbf{ncode}$ , B is an  $\mathbf{ncode}$  by  $\mathbf{ncode}$  matrix, C is an  $\mathbf{ncode}$  by  $(n_{\xi} \times \mathbf{npde})$  matrix and the entries in A, B and C may depend on t,  $\xi$ ,  $U^*$ ,  $U_x^*$  and V. In practice you only need to supply a vector of information to define the ODEs and not the matrices B and C. (See Section 5 for the specification of  $\mathbf{odedef}$ .)

The integration in time is from  $t_0$  to  $t_{\text{out}}$ , over the space interval  $a \le x \le b$ , where  $a = x_1$  and  $b = x_{\text{npts}}$  are the leftmost and rightmost points of a mesh  $x_1, x_2, \ldots, x_{\text{npts}}$  defined initially by you and (possibly) adapted automatically during the integration according to user-specified criteria.

The PDE system which is defined by the functions  $G_i$  must be specified in **pdedef**.

The initial  $(t = t_0)$  values of the functions U(x,t) and V(t) must be specified in **uvinit**. Note that **uvinit** will be called again following any remeshing, and so  $U(x,t_0)$  should be specified for **all** values of x in the interval  $a \le x \le b$ , and not just the initial mesh points.

For a first-order system of PDEs, only one boundary condition is required for each PDE component  $U_i$ . The **npde** boundary conditions are separated into  $n_a$  at the left-hand boundary x=a, and  $n_b$  at the right-hand boundary x=b, such that  $n_a+n_b=$  **npde**. The position of the boundary condition for each component should be chosen with care; the general rule is that if the characteristic direction of  $U_i$  at the left-hand boundary (say) points into the interior of the solution domain, then the boundary condition for  $U_i$  should be specified at the left-hand boundary. Incorrect positioning of boundary conditions generally results in initialization or integration difficulties in the underlying time integration functions.

The boundary conditions have the master equation form:

$$G_i^L(x, t, U, U_t, V, \dot{V}) = 0$$
 at  $x = a, i = 1, 2, ..., n_a,$  (5)

at the left-hand boundary, and

$$G_i^R(x, t, U, U_t, V, \dot{V}) = 0$$
 at  $x = b, i = 1, 2, ..., n_b,$  (6)

at the right-hand boundary.

Note that the functions  $G_i^L$  and  $G_i^R$  must not depend on  $U_x$ , since spatial derivatives are not determined explicitly in the Keller box scheme functions. If the problem involves derivative (Neumann) boundary conditions then it is generally possible to restate such boundary conditions in terms of permissible variables. Also note that  $G_i^L$  and  $G_i^R$  must be linear with respect to time derivatives, so that the boundary conditions have the general form:

d03prc.2 Mark 26

$$\sum_{j=1}^{\text{npde}} E_{i,j}^{L} \frac{\partial U_{j}}{\partial t} + \sum_{j=1}^{\text{ncode}} H_{i,j}^{L} \dot{V}_{j} + K_{i}^{L} = 0, \quad i = 1, 2, \dots, n_{a},$$
 (7)

at the left-hand boundary, and

$$\sum_{j=1}^{\text{npde}} E_{i,j}^{R} \frac{\partial U_{j}}{\partial t} + \sum_{j=1}^{\text{ncode}} H_{i,j}^{R} \dot{V}_{j} + K_{i}^{R} = 0, \quad i = 1, 2, \dots, n_{b},$$
(8)

at the right-hand boundary, where  $E_{i,j}^L$ ,  $E_{i,j}^R$ ,  $H_{i,j}^L$ ,  $H_{i,j}^R$ ,  $K_i^L$  and  $K_i^R$  depend on x,t,U and V only.

The boundary conditions must be specified in bndary.

The problem is subject to the following restrictions:

- (i)  $P_{i,j}$ ,  $Q_{i,j}$  and  $S_i$  must not depend on any time derivatives;
- (ii)  $t_0 < t_{\text{out}}$ , so that integration is in the forward direction;
- (iii) The evaluation of the function  $G_i$  is done approximately at the mid-points of the mesh  $\mathbf{x}[i-1]$ , for  $i=1,2,\ldots,\mathbf{npts}$ , by calling **pdedef** for each mid-point in turn. Any discontinuities in the function **must** therefore be at one or more of the fixed mesh points specified by  $\mathbf{xfix}$ ;
- (iv) At least one of the functions  $P_{i,j}$  must be nonzero so that there is a time derivative present in the PDE problem.

The algebraic-differential equation system which is defined by the functions  $R_i$  must be specified in **odedef**. You must also specify the coupling points  $\xi$  in the array xi.

The first-order equations are approximated by a system of ODEs in time for the values of  $U_i$  at mesh points. In this method of lines approach the Keller box scheme is applied to each PDE in the space variable only, resulting in a system of ODEs in time for the values of  $U_i$  at each mesh point. In total there are  $\mathbf{npde} \times \mathbf{npts} + \mathbf{ncode}$  ODEs in time direction. This system is then integrated forwards in time using a Backward Differentiation Formula (BDF) or a Theta method.

The adaptive space remeshing can be used to generate meshes that automatically follow the changing time-dependent nature of the solution, generally resulting in a more efficient and accurate solution using fewer mesh points than may be necessary with a fixed uniform or non-uniform mesh. Problems with travelling wavefronts or variable-width boundary layers for example will benefit from using a moving adaptive mesh. The discrete time-step method used here (developed by Furzeland (1984)) automatically creates a new mesh based on the current solution profile at certain time-steps, and the solution is then interpolated onto the new mesh and the integration continues.

The method requires you to supply **monitf** which specifies in an analytic or numeric form the particular aspect of the solution behaviour you wish to track. This so-called monitor function is used to choose a mesh which equally distributes the integral of the monitor function over the domain. A typical choice of monitor function is the second space derivative of the solution value at each point (or some combination of the second space derivatives if more than one solution component), which results in refinement in regions where the solution gradient is changing most rapidly.

You must specify the frequency of mesh updates along with certain other criteria such as adjacent mesh ratios. Remeshing can be expensive and you are encouraged to experiment with the different options in order to achieve an efficient solution which adequately tracks the desired features of the solution.

Note that unless the monitor function for the initial solution values is zero at all user-specified initial mesh points, a new initial mesh is calculated and adopted according to the user-specified remeshing criteria. **uvinit** will then be called again to determine the initial solution values at the new mesh points (there is no interpolation at this stage) and the integration proceeds.

# 5 Arguments

1: **npde** – Integer Input

On entry: the number of PDEs to be solved.

Constraint:  $npde \ge 1$ .

2: **ts** – double \* *Input/Output* 

On entry: the initial value of the independent variable t.

Constraint: ts < tout.

On exit: the value of t corresponding to the solution values in **u**. Normally  $\mathbf{ts} = \mathbf{tout}$ .

3: tout – double Input

On entry: the final value of t to which the integration is to be carried out.

4: **pdedef** – function, supplied by the user *External Function* 

**pdedef** must evaluate the functions  $G_i$  which define the system of PDEs. **pdedef** is called approximately midway between each pair of mesh points in turn by nag\_pde\_parab\_1d\_keller\_ode\_remesh (d03prc).

```
The specification of pdedef is:
```

```
void pdedef (Integer npde, double t, double x, const double u[],
    const double udot[], const double ux[], Integer ncode,
    const double v[], const double vdot[], double res[],
    Integer *ires, Nag_Comm *comm)
```

1: **npde** – Integer Input

On entry: the number of PDEs in the system.

 $2: \quad \mathbf{t} - \text{double}$  Input

On entry: the current value of the independent variable t.

3:  $\mathbf{x}$  - double Input

On entry: the current value of the space variable x.

d03prc.4 Mark 26

4:  $\mathbf{u}[\mathbf{npde}] - \text{const double}$ 

Input

On entry:  $\mathbf{u}[i-1]$  contains the value of the component  $U_i(x,t)$ , for  $i=1,2,\ldots,$  npde.

5: **udot**[**npde**] – const double

Input

On entry:  $\mathbf{udot}[i-1]$  contains the value of the component  $\frac{\partial U_i(x,t)}{\partial t}$ , for  $i=1,2,\ldots,\mathbf{npde}$ .

6: **ux[npde**] – const double

Input

On entry:  $\mathbf{ux}[i-1]$  contains the value of the component  $\frac{\partial U_i(x,t)}{\partial x}$ , for  $i=1,2,\ldots,\mathbf{npde}$ .

7: **ncode** – Integer

Input

On entry: the number of coupled ODEs in the system.

8:  $\mathbf{v}[\mathbf{ncode}] - \mathbf{const} \ \mathbf{double}$ 

Input

On entry: if  $\mathbf{ncode} > 0$ ,  $\mathbf{v}[i-1]$  contains the value of the component  $V_i(t)$ , for  $i = 1, 2, \dots, \mathbf{ncode}$ .

9: **vdot**[**ncode**] – const double

Input

On entry: if  $\mathbf{ncode} > 0$ ,  $\mathbf{vdot}[i-1]$  contains the value of component  $\dot{V}_i(t)$ , for  $i = 1, 2, \dots, \mathbf{ncode}$ .

10: res[npde] - double

Output

On exit: res[i-1] must contain the *i*th component of G, for  $i=1,2,\ldots,npde$ , where G is defined as

$$G_{i} = \sum_{j=1}^{\text{npde}} P_{i,j} \frac{\partial U_{j}}{\partial t} + \sum_{j=1}^{\text{ncode}} Q_{i,j} \dot{V}_{j}, \tag{9}$$

i.e., only terms depending explicitly on time derivatives, or

$$G_i = \sum_{j=1}^{\text{npde}} P_{i,j} \frac{\partial U_j}{\partial t} + \sum_{j=1}^{\text{ncode}} Q_{i,j} \dot{V}_j + S_i, \tag{10}$$

i.e., all terms in equation (3).

The definition of G is determined by the input value of **ires**.

11: **ires** – Integer \*

Input/Output

On entry: the form of  $G_i$  that must be returned in the array res.

ires = -1

Equation (9) must be used.

ires = 1

Equation (10) must be used.

On exit: should usually remain unchanged. However, you may set **ires** to force the integration function to take certain actions, as described below:

ires = 2

Indicates to the integrator that control should be passed back immediately to the calling function with the error indicator set to **fail.code** = NE USER STOP.

Mark 26

```
ires = 3
```

Indicates to the integrator that the current time step should be abandoned and a smaller time step used instead. You may wish to set **ires** = 3 when a physically meaningless input or output value has been generated. If you consecutively set **ires** = 3, then nag\_pde\_parab\_1d\_keller\_ode\_remesh (d03prc) returns to the calling function with the error indicator set to **fail.code** = NE\_FAILED\_DERIV.

12: comm - Nag Comm \*

Pointer to structure of type Nag Comm; the following members are relevant to pdedef.

```
user - double *
iuser - Integer *
p - Pointer
```

The type Pointer will be <code>void \*</code>. Before calling nag\_pde\_parab\_1d\_keller\_ode\_remesh (d03prc) you may allocate memory and initialize these pointers with various quantities for use by **pdedef** when called from nag\_pde\_parab\_1d\_keller\_ode\_remesh (d03prc) (see Section 2.3.1.1 in How to Use the NAG Library and its Documentation).

5: **bndary** – function, supplied by the user

External Function

**bndary** must evaluate the functions  $G_i^L$  and  $G_i^R$  which describe the boundary conditions, as given in (5) and (6).

```
The specification of bndary is:
```

```
void bndary (Integer npde, double t, Integer ibnd, Integer nobc,
    const double u[], const double udot[], Integer ncode,
    const double v[], const double vdot[], double res[],
    Integer *ires, Nag_Comm *comm)
```

1: **npde** – Integer

Input

On entry: the number of PDEs in the system.

2: **t** – double

On entry: the current value of the independent variable t.

3: **ibnd** – Integer

Input

Input

On entry: specifies which boundary conditions are to be evaluated.

ibnd = 0

**bndary** must compute the left-hand boundary condition at x = a.

ibnd  $\neq 0$ 

**bndary** must compute of the right-hand boundary condition at x = b.

4: **nobc** – Integer

Input

On entry: specifies the number  $n_a$  of boundary conditions at the boundary specified by **ibnd**.

5:  $\mathbf{u}[\mathbf{npde}] - \mathbf{const} \ \mathbf{double}$ 

Input

On entry:  $\mathbf{u}[i-1]$  contains the value of the component  $U_i(x,t)$  at the boundary specified by **ibnd**, for  $i=1,2,\ldots,$  **npde**.

d03prc.6 Mark 26

6: **udot**[**npde**] – const double

Input

On entry:  $\mathbf{udot}[i-1]$  contains the value of the component  $\frac{\partial U_i(x,t)}{\partial t}$ , for  $i=1,2,\ldots,\mathbf{npde}$ .

7: **ncode** – Integer

Input

On entry: the number of coupled ODEs in the system.

8:  $\mathbf{v}[\mathbf{ncode}] - \mathbf{const} \ \mathbf{double}$ 

Input

On entry: if  $\mathbf{ncode} > 0$ ,  $\mathbf{v}[i-1]$  contains the value of the component  $V_i(t)$ , for  $i = 1, 2, \dots, \mathbf{ncode}$ .

9: **vdot**[**ncode**] – const double

Input

On entry: if  $\mathbf{ncode} > 0$ ,  $\mathbf{vdot}[i-1]$  contains the value of component  $\dot{V}_i(t)$ , for  $i = 1, 2, \dots, \mathbf{ncode}$ .

**Note:**  $\mathbf{vdot}[i-1]$ , for  $i=1,2,\ldots,\mathbf{ncode}$ , may only appear linearly as in (11) and (12).

10: res[nobc] – double

Output

On exit: res[i-1] must contain the *i*th component of  $G^L$  or  $G^R$ , depending on the value of **ibnd**, for i = 1, 2, ..., nobc, where  $G^L$  is defined as

$$G_i^L = \sum_{j=1}^{\text{npde}} E_{i,j}^L \frac{\partial U_j}{\partial t} + \sum_{j=1}^{\text{ncode}} H_{i,j}^L \dot{V}_j, \tag{11}$$

i.e., only terms depending explicitly on time derivatives, or

$$G_i^L = \sum_{i=1}^{\text{npde}} E_{i,j}^L \frac{\partial U_j}{\partial t} + \sum_{i=1}^{\text{ncode}} H_{i,j}^L \dot{V}_j + K_i^L, \tag{12}$$

i.e., all terms in equation (7), and similarly for  $G_i^R$ .

The definitions of  $G^L$  and  $G^R$  are determined by the input value of **ires**.

11: **ires** – Integer \*

Input/Output

On entry: the form of  $G_i^L$  (or  $G_i^R$ ) that must be returned in the array res.

ires = -1

Equation (11) must be used.

ires = 1

Equation (12) must be used.

On exit: should usually remain unchanged. However, you may set **ires** to force the integration function to take certain actions as described below:

ires = 2

Indicates to the integrator that control should be passed back immediately to the calling function with the error indicator set to **fail.code** = NE USER STOP.

ires = 3

Indicates to the integrator that the current time step should be abandoned and a smaller time step used instead. You may wish to set **ires** = 3 when a physically meaningless input or output value has been generated. If you consecutively set **ires** = 3, then nag\_pde\_parab\_ld\_keller\_ode\_remesh (d03prc) returns to the calling function with the error indicator set to **fail.code** = NE FAILED DERIV.

```
12: comm – Nag Comm *
```

Pointer to structure of type Nag\_Comm; the following members are relevant to bndary.

```
user - double *
iuser - Integer *
p - Pointer
```

The type Pointer will be <code>void \*</code>. Before calling nag\_pde\_parab\_1d\_keller\_ode\_remesh (d03prc) you may allocate memory and initialize these pointers with various quantities for use by **bndary** when called from nag\_pde\_parab\_1d\_kel ler\_ode\_remesh (d03prc) (see Section 2.3.1.1 in How to Use the NAG Library and its Documentation).

6: **uvinit** – function, supplied by the user

External Function

**uvinit** must supply the initial  $(t = t_0)$  values of U(x,t) and V(t) for all values of x in the interval [a,b].

```
The specification of uvinit is:
```

1: **npde** – Integer

Input

On entry: the number of PDEs in the system.

2: **npts** – Integer

Input

On entry: the number of mesh points in the interval [a, b].

3: **nxi** – Integer

Input

On entry: the number of ODE/PDE coupling points.

4: x[npts] – const double

Input

On entry: the current mesh.  $\mathbf{x}[i-1]$  contains the value of  $x_i$ , for  $i=1,2,\ldots,\mathbf{npts}$ .

5: xi[nxi] - const double

Input

On entry: if  $\mathbf{nxi} > 0$ ,  $\mathbf{xi}[i-1]$  contains the ODE/PDE coupling point,  $\xi_i$ , for  $i = 1, 2, ..., \mathbf{nxi}$ .

6:  $\mathbf{u}[\mathbf{npde} \times \mathbf{npts}] - \mathbf{double}$ 

Output

On exit: if  $\mathbf{nxi} > 0$ ,  $\mathbf{u}[\mathbf{npde} \times (j-1) + i - 1]$  contains the value of the component  $U_i(x_i, t_0)$ , for  $i = 1, 2, \dots, \mathbf{npde}$  and  $j = 1, 2, \dots, \mathbf{npts}$ .

7: **ncode** – Integer

Input

On entry: the number of coupled ODEs in the system.

8:  $\mathbf{v}[\mathbf{ncode}] - \mathbf{double}$ 

Output

On exit: if  $\mathbf{ncode} > 0$ ,  $\mathbf{v}[i-1]$  must contain the value of component  $V_i(t_0)$ , for  $i = 1, 2, \dots, \mathbf{ncode}$ .

9: comm – Nag Comm \*

Pointer to structure of type Nag\_Comm; the following members are relevant to uvinit.

d03prc.8 Mark 26

```
user - double *
iuser - Integer *
p - Pointer
```

The type Pointer will be void \*. Before calling nag\_pde\_parab\_1d\_keller\_ode\_remesh (d03prc) you may allocate memory and initialize these pointers with various quantities for use by **uvinit** when called from nag\_pde\_parab\_1d\_keller\_ode\_remesh (d03prc) (see Section 2.3.1.1 in How to Use the NAG Library and its Documentation).

# 7: $\mathbf{u}[\mathbf{neqn}] - double$

Input/Output

On entry: if ind = 1, the value of u must be unchanged from the previous call.

On exit:  $\mathbf{u}[\mathbf{npde} \times (j-1) + i - 1]$  contains the computed solution  $U_i(x_j, t)$ , for  $i = 1, 2, ..., \mathbf{npde}$  and  $j = 1, 2, ..., \mathbf{npts}$ , evaluated at  $t = \mathbf{ts}$ .

8: **npts** – Integer

Input

On entry: the number of mesh points in the interval [a, b].

Constraint:  $npts \ge 3$ .

9:  $\mathbf{x}[\mathbf{npts}] - double$ 

Input/Output

On entry: the initial mesh points in the space direction.  $\mathbf{x}[0]$  must specify the left-hand boundary, a, and  $\mathbf{x}[\mathbf{npts}-1]$  must specify the right-hand boundary, b.

*Constraint*:  $x[0] < x[1] < \cdots < x[npts - 1]$ .

On exit: the final values of the mesh points.

10: **nleft** – Integer

Input

On entry: the number  $n_a$  of boundary conditions at the left-hand mesh point  $\mathbf{x}[0]$ .

Constraint:  $0 \le \mathbf{nleft} \le \mathbf{npde}$ .

11: **ncode** – Integer

Input

On entry: the number of coupled ODE components.

Constraint:  $\mathbf{ncode} \geq 0$ .

12: **odedef** – function, supplied by the user

External Function

**odedef** must evaluate the functions R, which define the system of ODEs, as given in (4).

If **ncode** = 0, **odedef** will never be called and the NAG defined null void function pointer, NULLFN, can be supplied in the call to nag pde parab\_1d\_keller\_ode\_remesh (d03prc).

```
The specification of odedef is:
```

```
void odedef (Integer npde, double t, Integer ncode, const double v[],
    const double vdot[], Integer nxi, const double xi[],
    const double ucp[], const double ucpx[], const double ucpt[],
    double r[], Integer *ires, Nag_Comm *comm)
```

1: **npde** – Integer

Input

On entry: the number of PDEs in the system.

2:  $\mathbf{t}$  – double

Input

On entry: the current value of the independent variable t.

3: **ncode** – Integer

Input

On entry: the number of coupled ODEs in the system.

4:  $\mathbf{v}[\mathbf{ncode}] - \mathbf{const} \ \mathbf{double}$ 

Input

On entry: if  $\mathbf{ncode} > 0$ ,  $\mathbf{v}[i-1]$  contains the value of the component  $V_i(t)$ , for  $i = 1, 2, \dots, \mathbf{ncode}$ .

5: **vdot**[**ncode**] – const double

Input

On entry: if  $\mathbf{ncode} > 0$ ,  $\mathbf{vdot}[i-1]$  contains the value of component  $\dot{V}_i(t)$ , for  $i = 1, 2, \dots, \mathbf{ncode}$ .

6: **nxi** – Integer

Input

On entry: the number of ODE/PDE coupling points.

7: xi[nxi] – const double

Input

On entry: if  $\mathbf{nxi} > 0$ ,  $\mathbf{xi}[i-1]$  contains the ODE/PDE coupling point,  $\xi_i$ , for  $i = 1, 2, ..., \mathbf{nxi}$ .

8:  $\mathbf{ucp}[\mathbf{npde} \times \mathbf{nxi}] - \text{const double}$ 

Input

On entry: if  $\mathbf{nxi} > 0$ ,  $\mathbf{ucp}[\mathbf{npde} \times (j-1) + i - 1]$  contains the value of  $U_i(x,t)$  at the coupling point  $x = \xi_j$ , for  $i = 1, 2, \dots, \mathbf{npde}$  and  $j = 1, 2, \dots, \mathbf{nxi}$ .

9:  $\mathbf{ucpx}[\mathbf{npde} \times \mathbf{nxi}] - \mathbf{const} \ \mathbf{double}$ 

Input

On entry: if  $\mathbf{nxi} > 0$ ,  $\mathbf{ucpx}[\mathbf{npde} \times (j-1) + i - 1]$  contains the value of  $\frac{\partial U_i(x,t)}{\partial x}$  at the coupling point  $x = \xi_i$ , for  $i = 1, 2, ..., \mathbf{npde}$  and  $j = 1, 2, ..., \mathbf{nxi}$ .

10:  $\mathbf{ucpt}[\mathbf{npde} \times \mathbf{nxi}] - \mathbf{const} \ \mathbf{double}$ 

Input

On entry: if  $\mathbf{nxi} > 0$ ,  $\mathbf{ucpt}[\mathbf{npde} \times (j-1) + i - 1]$  contains the value of  $\frac{\partial U_i}{\partial t}$  at the coupling point  $x = \xi_j$ , for  $i = 1, 2, \dots, \mathbf{npde}$  and  $j = 1, 2, \dots, \mathbf{nxi}$ .

11:  $\mathbf{r}[\mathbf{ncode}] - \mathbf{double}$ 

Output

On exit: if  $\mathbf{ncode} > 0$ ,  $\mathbf{r}[i-1]$  must contain the *i*th component of R, for  $i = 1, 2, \dots, \mathbf{ncode}$ , where R is defined as

$$R = -B\dot{V} - CU_{\star}^{*},\tag{13}$$

i.e., only terms depending explicitly on time derivatives, or

$$R = A - B\dot{V} - CU_t^*,\tag{14}$$

i.e., all terms in equation (4). The definition of R is determined by the input value of **ires**.

12: ires – Integer \*

Input/Output

On entry: the form of R that must be returned in the array  $\mathbf{r}$ .

ires = -1

Equation (13) must be used.

ires — 1

Equation (14) must be used.

d03prc.10 Mark 26

On exit: should usually remain unchanged. However, you may reset **ires** to force the integration function to take certain actions, as described below:

ires = 2

Indicates to the integrator that control should be passed back immediately to the calling function with the error indicator set to **fail.code** = NE USER STOP.

ires = 3

Indicates to the integrator that the current time step should be abandoned and a smaller time step used instead. You may wish to set **ires** = 3 when a physically meaningless input or output value has been generated. If you consecutively set **ires** = 3, then nag\_pde\_parab\_1d\_keller\_ode\_remesh (d03prc) returns to the calling function with the error indicator set to **fail.code** = NE FAILED DERIV.

13: **comm** – Nag\_Comm \*

Pointer to structure of type Nag Comm; the following members are relevant to odedef.

```
user - double *
iuser - Integer *
p - Pointer
```

The type Pointer will be void \*. Before calling nag\_pde\_parab\_1d\_keller\_ode\_remesh (d03prc) you may allocate memory and initialize these pointers with various quantities for use by **odedef** when called from nag\_pde\_parab\_1d\_keller\_ode\_remesh (d03prc) (see Section 2.3.1.1 in How to Use the NAG Library and its Documentation).

13: **nxi** – Integer Input

On entry: the number of ODE/PDE coupling points.

Constraints:

```
if \mathbf{ncode} = 0, \mathbf{nxi} = 0; if \mathbf{ncode} > 0, \mathbf{nxi} \ge 0.
```

14: xi[dim] – const double

Input

**Note**: the dimension, dim, of the array **xi** must be at least max $(1, \mathbf{nxi})$ .

On entry: xi[i-1], for  $i=1,2,\ldots,nxi$ , must be set to the ODE/PDE coupling points,  $\xi_i$ .

Constraint:  $\mathbf{x}[0] \leq \mathbf{xi}[0] < \mathbf{xi}[1] < \cdots < \mathbf{xi}[\mathbf{nxi} - 1] \leq \mathbf{x}[\mathbf{npts} - 1]$ .

15: **neqn** – Integer Input

On entry: the number of ODEs in the time direction.

Constraint:  $neqn = npde \times npts + ncode$ .

16:  $\mathbf{rtol}[dim] - \mathbf{const} \ \mathbf{double}$ 

Input

Note: the dimension, dim, of the array rtol must be at least

```
1 when itol = 1 or 2;

neqn when itol = 3 or 4.
```

On entry: the relative local error tolerance.

Constraint:  $\mathbf{rtol}[i-1] \ge 0.0$  for all relevant i.

17: atol[dim] - const double

Input

Note: the dimension, dim, of the array atol must be at least

1 when itol = 1 or 3; neqn when itol = 2 or 4.

On entry: the absolute local error tolerance.

Constraint:  $atol[i-1] \ge 0.0$  for all relevant i.

Note: corresponding elements of rtol and atol cannot both be 0.0.

18: **itol** – Integer

Input

A value to indicate the form of the local error test. **itol** indicates to nag\_pde\_parab\_1d\_keller\_ode\_remesh (d03prc) whether to interpret either or both of **rtol** or **atol** as a vector or scalar. The error test to be satisfied is  $||e_i/w_i|| < 1.0$ , where  $w_i$  is defined as follows:

On entry:

itol	rtol	atol	$w_{i}$
1	scalar	scalar	$rtol[0]  imes  \mathbf{u}[i-1]  + atol[0]$
2	scalar	vector	$rtol[0]  imes  \mathbf{u}[i-1]  + atol[i-1]$
3	vector	scalar	$rtol[i-1]  imes  \mathbf{u}[i-1]  + atol[0]$
4	vector	vector	$rtol[i-1] \times  u[i-1]  + atol[i-1]$

In the above,  $e_i$  denotes the estimated local error for the *i*th component of the coupled PDE/ODE system in time,  $\mathbf{u}[i-1]$ , for  $i=1,2,\ldots,\mathbf{neqn}$ .

The choice of norm used is defined by the argument norm.

Constraint: **itol** = 1, 2, 3 or 4.

19: **norm** – Nag\_NormType

Input

On entry: the type of norm to be used.

norm = Nag\_MaxNorm

Maximum norm.

**norm** = Nag\_TwoNorm

Averaged  $L_2$  norm.

If  $U_{\text{norm}}$  denotes the norm of the vector  $\mathbf{u}$  of length **neqn**, then for the averaged  $L_2$  norm

$$U_{
m norm} = \sqrt{rac{1}{{
m neqn}}} {rac{1}{{
m neqn}}} {(U(i)/w_i)}^2,$$

while for the maximum norm

$$U_{\text{norm}} = \max_{i} |\mathbf{u}[i-1]/w_i|.$$

See the description of **itol** for the formulation of the weight vector w.

Constraint: **norm** = Nag\_MaxNorm or Nag\_TwoNorm.

20: **laopt** – Nag\_LinAlgOption

Input

On entry: the type of matrix algebra required.

laopt = Nag\_LinAlgFull

Full matrix methods to be used.

**laopt** = Nag\_LinAlgBand

Banded matrix methods to be used.

d03prc.12

#### **laopt** = Nag\_LinAlgSparse

Sparse matrix methods to be used.

Constraint: laopt = Nag\_LinAlgFull, Nag\_LinAlgBand or Nag\_LinAlgSparse.

**Note**: you are recommended to use the banded option when no coupled ODEs are present (i.e.,  $\mathbf{ncode} = 0$ ).

## 21: **algopt**[30] – const double

Input

On entry: may be set to control various options available in the integrator. If you wish to employ all the default options, then **algopt**[0] should be set to 0.0. Default values will also be used for any other elements of **algopt** set to zero. The permissible values, default values, and meanings are as follows:

## algopt[0]

Selects the ODE integration method to be used. If  $\mathbf{algopt}[0] = 1.0$ , a BDF method is used and if  $\mathbf{algopt}[0] = 2.0$ , a Theta method is used. The default value is  $\mathbf{algopt}[0] = 1.0$ .

If  $\mathbf{algopt}[0] = 2.0$ , then  $\mathbf{algopt}[i-1]$ , for i = 2, 3, 4, are not used.

## algopt[1]

Specifies the maximum order of the BDF integration formula to be used. algopt[1] may be 1.0, 2.0, 3.0, 4.0 or 5.0. The default value is algopt[1] = 5.0.

#### algopt[2]

Specifies what method is to be used to solve the system of nonlinear equations arising on each step of the BDF method. If  $\mathbf{algopt}[2] = 1.0$  a modified Newton iteration is used and if  $\mathbf{algopt}[2] = 2.0$  a functional iteration method is used. If functional iteration is selected and the integrator encounters difficulty, then there is an automatic switch to the modified Newton iteration. The default value is  $\mathbf{algopt}[2] = 1.0$ .

## algopt[3]

Specifies whether or not the Petzold error test is to be employed. The Petzold error test results in extra overhead but is more suitable when algebraic equations are present, such as  $P_{i,j} = 0.0$ , for  $j = 1, 2, \ldots, \mathbf{npde}$ , for some i or when there is no  $V_i(t)$  dependence in the coupled ODE system. If  $\mathbf{algopt}[3] = 1.0$ , then the Petzold test is used. If  $\mathbf{algopt}[3] = 2.0$ , then the Petzold test is not used. The default value is  $\mathbf{algopt}[3] = 1.0$ .

If  $\mathbf{algopt}[0] = 1.0$ , then  $\mathbf{algopt}[i-1]$ , for i = 5, 6, 7, are not used.

#### algopt[4]

Specifies the value of Theta to be used in the Theta integration method.  $0.51 \le \mathbf{algopt}[4] \le 0.99$ . The default value is  $\mathbf{algopt}[4] = 0.55$ .

## algopt[5]

Specifies what method is to be used to solve the system of nonlinear equations arising on each step of the Theta method. If  $\mathbf{algopt}[5] = 1.0$ , a modified Newton iteration is used and if  $\mathbf{algopt}[5] = 2.0$ , a functional iteration method is used. The default value is  $\mathbf{algopt}[5] = 1.0$ .

## algopt[6]

Specifies whether or not the integrator is allowed to switch automatically between modified Newton and functional iteration methods in order to be more efficient. If  $\mathbf{algopt}[6] = 1.0$ , then switching is allowed and if  $\mathbf{algopt}[6] = 2.0$ , then switching is not allowed. The default value is  $\mathbf{algopt}[6] = 1.0$ .

## algopt[10]

Specifies a point in the time direction,  $t_{\rm crit}$ , beyond which integration must not be attempted. The use of  $t_{\rm crit}$  is described under the argument **itask**. If  ${\bf algopt}[0] \neq 0.0$ , a value of 0.0, for  ${\bf algopt}[10]$ , say, should be specified even if **itask** subsequently specifies that  $t_{\rm crit}$  will not be used.

## algopt[11]

Specifies the minimum absolute step size to be allowed in the time integration. If this option is not required, **algopt**[11] should be set to 0.0.

## algopt[12]

Specifies the maximum absolute step size to be allowed in the time integration. If this option is not required, **algopt**[12] should be set to 0.0.

#### algopt[13]

Specifies the initial step size to be attempted by the integrator. If  $\mathbf{algopt}[13] = 0.0$ , then the initial step size is calculated internally.

#### algopt[14

Specifies the maximum number of steps to be attempted by the integrator in any one call. If  $\mathbf{algopt}[14] = 0.0$ , then no limit is imposed.

## algopt[22]

Specifies what method is to be used to solve the nonlinear equations at the initial point to initialize the values of U,  $U_t$ , V and  $\dot{V}$ . If  $\mathbf{algopt}[22] = 1.0$ , a modified Newton iteration is used and if  $\mathbf{algopt}[22] = 2.0$ , functional iteration is used. The default value is  $\mathbf{algopt}[22] = 1.0$ .

**algopt**[28] and **algopt**[29] are used only for the sparse matrix algebra option, i.e., **laopt** = Nag\_LinAlgSparse.

## algopt[28]

Governs the choice of pivots during the decomposition of the first Jacobian matrix. It should lie in the range  $0.0 < \mathbf{algopt}[28] < 1.0$ , with smaller values biasing the algorithm towards maintaining sparsity at the expense of numerical stability. If  $\mathbf{algopt}[28]$  lies outside this range then the default value is used. If the functions regard the Jacobian matrix as numerically singular then increasing  $\mathbf{algopt}[28]$  towards 1.0 may help, but at the cost of increased fill-in. The default value is  $\mathbf{algopt}[28] = 0.1$ .

## algopt[29]

Used as a relative pivot threshold during subsequent Jacobian decompositions (see  $\mathbf{algopt}[28]$ ) below which an internal error is invoked.  $\mathbf{algopt}[29]$  must be greater than zero, otherwise the default value is used. If  $\mathbf{algopt}[29]$  is greater than 1.0 no check is made on the pivot size, and this may be a necessary option if the Jacobian is found to be numerically singular (see  $\mathbf{algopt}[28]$ ). The default value is  $\mathbf{algopt}[29] = 0.0001$ .

# 22: **remesh** – Nag\_Boolean

Input

On entry: indicates whether or not spatial remeshing should be performed.

## $remesh = Nag\_TRUE$

Indicates that spatial remeshing should be performed as specified.

## $remesh = Nag\_FALSE$

Indicates that spatial remeshing should be suppressed.

**Note:** remesh should **not** be changed between consecutive calls to nag\_pde\_parab\_1d\_keller\_ode\_remesh (d03prc). Remeshing can be switched off or on at specified times by using appropriate values for the arguments **nrmesh** and **trmesh** at each call.

## 23: **nxfix** – Integer

Input

On entry: the number of fixed mesh points.

Constraint:  $0 \le \mathbf{nxfix} \le \mathbf{npts} - 2$ .

**Note**: the end points  $\mathbf{x}[0]$  and  $\mathbf{x}[\mathbf{npts}-1]$  are fixed automatically and hence should not be specified as fixed points.

## 24: $\mathbf{xfix}[dim]$ – const double

Input

**Note**: the dimension, dim, of the array **xfix** must be at least max $(1, \mathbf{nxfix})$ .

d03prc.14 Mark 26

On entry:  $\mathbf{xfix}[i-1]$ , for  $i=1,2,\ldots,\mathbf{nxfix}$ , must contain the value of the x coordinate at the ith fixed mesh point.

Constraint:  $\mathbf{xfix}[i-1] < \mathbf{xfix}[i]$ , for  $i = 1, 2, ..., \mathbf{nxfix} - 1$ , and each fixed mesh point must coincide with a user-supplied initial mesh point, that is  $\mathbf{xfix}[i-1] = \mathbf{x}[j-1]$  for some j,  $2 \le j \le \mathbf{npts} - 1$ .

**Note**: the positions of the fixed mesh points in the array  $\mathbf{x}$  remain fixed during remeshing, and so the number of mesh points between adjacent fixed points (or between fixed points and end points) does not change. You should take this into account when choosing the initial mesh distribution.

### 25: **nrmesh** – Integer

Input

On entry: indicates the form of meshing to be performed.

#### nrmesh < 0

Indicates that a new mesh is adopted according to the argument **dxmesh**. The mesh is tested every |**nrmesh**| timesteps.

#### nrmesh = 0

Indicates that remeshing should take place just once at the end of the first time step reached when  $t > \mathbf{trmesh}$ .

### nrmesh > 0

Indicates that remeshing will take place every **nrmesh** time steps, with no testing using **dxmesh**.

**Note**: **nrmesh** may be changed between consecutive calls to nag\_pde\_parab\_1d\_keller\_ode\_r emesh (d03prc) to give greater flexibility over the times of remeshing.

#### 26: **dxmesh** – double

Input

On entry: determines whether a new mesh is adopted when **nrmesh** is set less than zero. A possible new mesh is calculated at the end of every |**nrmesh**| time steps, but is adopted only if

$$x_i^{\mathrm{new}} > x_i^{\mathrm{old}} + \mathbf{dxmesh} \times (x_{i+1}^{\mathrm{old}} - x_i^{\mathrm{old}}),$$

or

$$x_i^{\text{new}} < x_i^{\text{old}} - \mathbf{dxmesh} \times (x_i^{\text{old}} - x_{i-1}^{\text{old}}).$$

dxmesh thus imposes a lower limit on the difference between one mesh and the next.

Constraint:  $dxmesh \ge 0.0$ .

### 27: **trmesh** – double

Input

On entry: specifies when remeshing will take place when **nrmesh** is set to zero. Remeshing will occur just once at the end of the first time step reached when t is greater than **trmesh**.

**Note**: **trmesh** may be changed between consecutive calls to nag\_pde\_parab\_1d\_keller\_ode\_r emesh (d03prc) to force remeshing at several specified times.

### 28: **ipminf** – Integer

Input

On entry: the level of trace information regarding the adaptive remeshing.

#### ipminf = 0

No trace information.

#### ipminf = 1

Brief summary of mesh characteristics.

#### ipminf = 2

More detailed information, including old and new mesh points, mesh sizes and monitor function values.

Constraint: ipminf = 0, 1 or 2.

29: **xratio** – double *Input* 

On entry: input bound on adjacent mesh ratio (greater than 1.0 and typically in the range 1.5 to 3.0). The remeshing functions will attempt to ensure that

$$(x_i - x_{i-1}) / \text{xratio} < x_{i+1} - x_i < \text{xratio} \times (x_i - x_{i-1}).$$

Suggested value:  $\mathbf{xratio} = 1.5$ .

Constraint: xratio > 1.0.

30: **con** – double Input

On entry: an input bound on the sub-integral of the monitor function  $F^{\text{mon}}(x)$  over each space step. The remeshing functions will attempt to ensure that

$$\int_{x_i}^{x_{i+1}} F^{\mathrm{mon}}(x) \, dx \leq \mathrm{con} \int_{x_i}^{x_{\mathrm{npts}}} F^{\mathrm{mon}}(x) \, dx,$$

(see Furzeland (1984)). **con** gives you more control over the mesh distribution e.g., decreasing **con** allows more clustering. A typical value is  $2/(\mathbf{npts} - 1)$ , but you are encouraged to experiment with different values. Its value is not critical and the mesh should be qualitatively correct for all values in the range given below.

Suggested value: con = 2.0/(npts - 1).

Constraint:  $0.1/(\text{npts} - 1) \le \text{con} \le 10.0/(\text{npts} - 1)$ .

31: **monitf** – function, supplied by the user

External Function

monitf must supply and evaluate a remesh monitor function to indicate the solution behaviour of interest.

If **ncode** = 0, **monitf** will never be called and the NAG defined null void function pointer, NULLFN, can be supplied in the call to nag pde parab 1d keller ode remesh (d03prc).

The specification of monitf is:

1:  $\mathbf{t}$  - double Input

On entry: the current value of the independent variable t.

2: **npts** – Integer Input

On entry: the number of mesh points in the interval [a, b].

3: **npde** – Integer Input

On entry: the number of PDEs in the system.

4:  $\mathbf{x}[\mathbf{npts}]$  – const double Input

On entry: the current mesh.  $\mathbf{x}[i-1]$  contains the value of  $x_i$ , for  $i=1,2,\ldots,\mathbf{npts}$ .

On entry:  $\mathbf{u}[\mathbf{npde} \times (j-1) + i - 1]$  contains the value of  $U_i(x,t)$  at  $x = \mathbf{x}[j-1]$  and time t, for  $i = 1, 2, ..., \mathbf{npde}$  and  $j = 1, 2, ..., \mathbf{npts}$ .

d03prc.16 Mark 26

## 6: **fmon**[**npts**] – double

Output

On exit: fmon[i-1] must contain the value of the monitor function  $F^{mon}(x)$  at mesh point  $x = \mathbf{x}[i-1]$ .

Constraint:  $\mathbf{fmon}[i-1] \geq 0.0$ .

7: **comm** - Nag\_Comm \*

Pointer to structure of type Nag\_Comm; the following members are relevant to monitf.

```
user - double *
iuser - Integer *
p - Pointer
```

The type Pointer will be <code>void \*</code>. Before calling nag\_pde\_parab\_1d\_keller\_ode\_remesh (d03prc) you may allocate memory and initialize these pointers with various quantities for use by **monitf** when called from nag\_pde\_parab\_1d\_keller\_ode\_remesh (d03prc) (see Section 2.3.1.1 in How to Use the NAG Library and its Documentation).

## 32: rsave[lrsave] - double

Communication Array

If ind = 0, rsave need not be set on entry.

If ind = 1, rsave must be unchanged from the previous call to the function because it contains required information about the iteration.

33: **Irsave** – Integer

Input

On entry: the dimension of the array **rsave**. Its size depends on the type of matrix algebra selected.

If  $laopt = Nag\_LinAlgFull$ ,  $lrsave \ge neqn \times neqn + neqn + nwkres + lenode$ .

If  $laopt = Nag\_LinAlgBand$ ,  $lrsave \ge (3 \times ml + mu + 2) \times neqn + nwkres + lenode$ .

If laopt = Nag\_LinAlgSparse, lrsave  $\geq 4 \times \text{neqn} + 11 \times \text{neqn}/2 + 1 + nwkres + lenode$ .

Where

ml and mu are the lower and upper half bandwidths given by  $ml = \mathbf{npde} + \mathbf{nleft} - 1$  such that  $mu = 2 \times \mathbf{npde} - \mathbf{nleft} - 1$ , for problems involving PDEs only; or  $ml = mu = \mathbf{neqn} - 1$ , for coupled PDE/ODE problems.

```
nwkres = \begin{cases} \textbf{npde} \times (3 \times \textbf{npde} + 6 \times \textbf{nxi} + \textbf{npts} + 15) + \textbf{nxi} + \textbf{ncode} + 7 \times \textbf{npts} + \textbf{nxfix} + 1, & \text{when } \textbf{ncode} > 0 \text{ and } \textbf{nxi} > 0; \text{ or } \textbf{npde} \times (3 \times \textbf{npde} + \textbf{npts} + 21) + \textbf{ncode} + 7 \times \textbf{npts} + \textbf{nxfix} + 2, & \text{when } \textbf{ncode} > 0 \text{ and } \textbf{nxi} = 0; \text{ or } \textbf{npde} \times (3 \times \textbf{npde} + \textbf{npts} + 21) + 7 \times \textbf{npts} + \textbf{nxfix} + 3, & \text{when } \textbf{ncode} = 0. \end{cases}
```

$$lenode = \begin{cases} (6 + \text{int}(\mathbf{algopt}[1])) \times \mathbf{neqn} + 50, & \text{when the BDF method is used; or} \\ 9 \times \mathbf{neqn} + 50, & \text{when the Theta method is used.} \end{cases}$$

**Note**: when using the sparse option, the value of **Irsave** may be too small when supplied to the integrator. An estimate of the minimum size of **Irsave** is printed on the current error message unit if **itrace** > 0 and the function returns with **fail.code** = NE INT 2.

# 34: isave[lisave] - Integer

Communication Array

If ind = 0, isave need not be set.

If ind = 1, isave must be unchanged from the previous call to the function because it contains required information about the iteration. In particular the following components of the array isave concern the efficiency of the integration:

isave[0]

Contains the number of steps taken in time.

isave[1]

Contains the number of residual evaluations of the resulting ODE system used. One such evaluation involves evaluating the PDE functions at all the mesh points, as well as one evaluation of the functions in the boundary conditions.

isave[2]

Contains the number of Jacobian evaluations performed by the time integrator.

isave[3]

Contains the order of the ODE method last used in the time integration.

isave[4]

Contains the number of Newton iterations performed by the time integrator. Each iteration involves residual evaluation of the resulting ODE system followed by a back-substitution using the LU decomposition of the Jacobian matrix.

The rest of the array is used as workspace.

35: lisave – Integer Input

On entry: the dimension of the array isave. Its size depends on the type of matrix algebra selected:

if  $laopt = Nag\_LinAlgFull$ ,  $lisave \ge 25 + nxfix$ ;

if  $laopt = Nag\_LinAlgBand$ ,  $lisave \ge neqn + 25 + nxfix$ ;

if  $laopt = Nag\_LinAlgSparse$ ,  $lisave \ge 25 \times neqn + 25 + nxfix$ .

**Note**: when using the sparse option, the value of **lisave** may be too small when supplied to the integrator. An estimate of the minimum size of **lisave** is printed if **itrace** > 0 and the function returns with **fail.code** = NE INT 2.

36: itask – Integer Input

On entry: the task to be performed by the ODE integrator.

itask = 1

Normal computation of output values  $\mathbf{u}$  at  $t = \mathbf{tout}$  (by overshooting and interpolating).

itask = 2

Take one step in the time direction and return.

itask = 3

Stop at first internal integration point at or beyond t = tout.

itask = 4

Normal computation of output values **u** at t =tout but without overshooting  $t = t_{\text{crit}}$  where  $t_{\text{crit}}$  is described under the argument **algopt**.

itask = 5

Take one step in the time direction and return, without passing  $t_{crit}$ , where  $t_{crit}$  is described under the argument **algopt**.

Constraint: itask = 1, 2, 3, 4 or 5.

37: **itrace** – Integer Input

On entry: the level of trace information required from nag\_pde\_parab\_1d\_keller\_ode\_remesh (d03prc) and the underlying ODE solver as follows:

itrace < -1

No output is generated.

itrace = 0

Only warning messages from the PDE solver are printed.

d03prc.18 Mark 26

#### itrace = 1

Output from the underlying ODE solver is printed . This output contains details of Jacobian entries, the nonlinear iteration and the time integration during the computation of the ODE system.

#### itrace = 2

Output from the underlying ODE solver is similar to that produced when **itrace** = 1, except that the advisory messages are given in greater detail.

#### itrace > 3

The output from the underlying ODE solver is similar to that produced when **itrace** = 2, except that the advisory messages are given in greater detail.

#### 38: **outfile** – const char \*

Input

On entry: the name of a file to which diagnostic output will be directed. If **outfile** is **NULL** the diagnostic output will be directed to standard output.

### 39: ind – Integer \*

Input/Output

On entry: indicates whether this is a continuation call or a new integration.

#### ind = 0

Starts or restarts the integration in time.

#### ind = 1

Continues the integration after an earlier exit from the function. In this case, only the arguments **tout** and **fail** and the remeshing arguments **nrmesh**, **dxmesh**, **trmesh**, **xratio** and **con** may be reset between calls to nag\_pde\_parab\_1d\_keller\_ode\_remesh (d03prc).

Constraint: ind = 0 or 1.

On exit: ind = 1.

#### 40: **comm** – Nag Comm \*

The NAG communication argument (see Section 2.3.1.1 in How to Use the NAG Library and its Documentation).

### 41: saved – Nag D03 Save \*

Communication Structure

**saved** must remain unchanged following a previous call to a Chapter d03 function and prior to any subsequent call to a Chapter d03 function.

# 42: **fail** – NagError \*

Input/Output

The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

# 6 Error Indicators and Warnings

## NE ACC IN DOUBT

Integration completed, but small changes in **atol** or **rtol** are unlikely to result in a changed solution.

## NE ALLOC FAIL

Dynamic memory allocation failed.

See Section 3.2.1.2 in How to Use the NAG Library and its Documentation for further information.

## **NE BAD PARAM**

On entry, argument \( \value \rangle \) had an illegal value.

# NE\_FAILED\_DERIV

In setting up the ODE system an internal auxiliary was unable to initialize the derivative. This could be due to your setting **ires** = 3 in **pdedef** or **bndary**.

## NE FAILED START

atol and rtol were too small to start integration.

#### NE FAILED STEP

Error during Jacobian formulation for ODE system. Increase itrace for further details.

Repeated errors in an attempted step of underlying ODE solver. Integration was successful as far as  $\mathbf{ts}$ :  $\mathbf{ts} = \langle value \rangle$ .

Underlying ODE solver cannot make further progress from the point **ts** with the supplied values of **atol** and **rtol**. **ts** =  $\langle value \rangle$ .

# **NE\_INCOMPAT\_PARAM**

```
On entry, \mathbf{con} = \langle value \rangle, \mathbf{npts} = \langle value \rangle.

Constraint: \mathbf{con} \leq 10.0/(\mathbf{npts}-1).

On entry, \mathbf{con} = \langle value \rangle, \mathbf{npts} = \langle value \rangle.

Constraint: \mathbf{con} \geq 0.1/(\mathbf{npts}-1).

On entry, the point \mathbf{xfix}[I-1] does not coincide with any \mathbf{x}[J-1]: I = \langle value \rangle and \mathbf{xfix}[I-1] = \langle value \rangle.
```

## NE INT

ires set to an invalid value in call to pdedef, bndary, or odedef.

```
On entry, ind = \langle value \rangle.
Constraint: ind = 0 or 1.
On entry, ipminf = \langle value \rangle.
Constraint: ipminf = 0, 1 or 2.
On entry, itask = \langle value \rangle.
Constraint: itask = 1, 2, 3, 4 \text{ or } 5.
On entry, itol = \langle value \rangle.
Constraint: itol = 1, 2, 3 or 4.
On entry, \mathbf{ncode} = \langle value \rangle.
Constraint: \mathbf{ncode} \geq 0.
On entry, \mathbf{nleft} = \langle value \rangle.
Constraint: \mathbf{nleft} > 0.
On entry, \mathbf{npde} = \langle value \rangle.
Constraint: npde \ge 1.
On entry, npts = \langle value \rangle.
Constraint: npts \ge 3.
On entry, \mathbf{nxfix} = \langle value \rangle.
Constraint: \mathbf{nxfix} \geq 0.
```

## NE\_INT\_2

On entry, corresponding elements  $\operatorname{atol}[I-1]$  and  $\operatorname{rtol}[J-1]$  are both zero:  $I = \langle value \rangle$  and  $J = \langle value \rangle$ .

d03prc.20 Mark 26

On entry, **lisave** is too small: **lisave** =  $\langle value \rangle$ . Minimum possible dimension:  $\langle value \rangle$ .

On entry, **Irsave** is too small: **Irsave** =  $\langle value \rangle$ . Minimum possible dimension:  $\langle value \rangle$ .

On entry,  $\mathbf{ncode} = \langle value \rangle$  and  $\mathbf{nxi} = \langle value \rangle$ .

Constraint:  $\mathbf{nxi} = 0$  when  $\mathbf{ncode} = 0$ .

On entry,  $\mathbf{ncode} = \langle value \rangle$  and  $\mathbf{nxi} = \langle value \rangle$ .

Constraint:  $\mathbf{nxi} > 0$  when  $\mathbf{ncode} > 0$ .

On entry,  $\mathbf{nleft} = \langle value \rangle$ ,  $\mathbf{npde} = \langle value \rangle$ .

Constraint:  $nleft \le npde$ .

On entry,  $\mathbf{nxfix} = \langle value \rangle$ ,  $\mathbf{npts} = \langle value \rangle$ .

Constraint:  $\mathbf{nxfix} \leq \mathbf{npts} - 2$ .

When using the sparse option **lisave** or **lrsave** is too small: **lisave** =  $\langle value \rangle$ , **lrsave** =  $\langle value \rangle$ .

## NE INT 4

```
On entry, \mathbf{neqn} = \langle value \rangle, \mathbf{npde} = \langle value \rangle, \mathbf{npts} = \langle value \rangle and \mathbf{ncode} = \langle value \rangle. Constraint: \mathbf{neqn} = \mathbf{npde} \times \mathbf{npts} + \mathbf{ncode}.
```

# NE\_INTERNAL\_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.

See Section 3.6.6 in How to Use the NAG Library and its Documentation for further information.

Serious error in internal call to an auxiliary. Increase itrace for further details.

## NE\_ITER\_FAIL

In solving ODE system, the maximum number of steps  $\mathbf{algopt}[14]$  has been exceeded.  $\mathbf{algopt}[14] = \langle value \rangle$ .

## NE\_NO\_LICENCE

Your licence key may have expired or may not have been installed correctly.

See Section 3.6.5 in How to Use the NAG Library and its Documentation for further information.

## NE NOT CLOSE FILE

Cannot close file \( \text{value} \).

## NE NOT STRICTLY INCREASING

```
On entry, I = \langle value \rangle, \mathbf{xfix}[I] = \langle value \rangle and \mathbf{xfix}[I-1] = \langle value \rangle.
```

Constraint:  $\mathbf{xfix}[I] > \mathbf{xfix}[I-1]$ .

On entry,  $I = \langle value \rangle$ ,  $\mathbf{xi}[I] = \langle value \rangle$  and  $\mathbf{xi}[I-1] = \langle value \rangle$ .

Constraint: xi[I] > xi[I-1].

On entry, mesh points  $\mathbf{x}$  appear to be badly ordered:  $I = \langle value \rangle$ ,  $\mathbf{x}[I-1] = \langle value \rangle$ ,  $J = \langle value \rangle$  and  $\mathbf{x}[J-1] = \langle value \rangle$ .

## NE NOT WRITE FILE

Cannot open file \( \nabla value \rangle \) for writing.

## NE REAL

```
On entry, \mathbf{dxmesh} = \langle value \rangle. Constraint: \mathbf{dxmesh} \geq 0.0.
```

```
On entry, xratio = \langle value \rangle. Constraint: xratio > 1.0.
```

## NE REAL 2

```
On entry, at least one point in xi lies outside [x[0], x[npts - 1]]: x[0] = \langle value \rangle and x[npts - 1] = \langle value \rangle.
```

```
On entry, tout = \langle value \rangle and ts = \langle value \rangle.
```

Constraint: tout > ts.

On entry, **tout** – **ts** is too small: **tout** =  $\langle value \rangle$  and **ts** =  $\langle value \rangle$ .

#### **NE REAL ARRAY**

```
On entry, I = \langle value \rangle and \mathbf{atol}[I-1] = \langle value \rangle. Constraint: \mathbf{atol}[I-1] \geq 0.0. On entry, I = \langle value \rangle and \mathbf{rtol}[I-1] = \langle value \rangle. Constraint: \mathbf{rtol}[I-1] \geq 0.0.
```

## **NE\_REMESH\_CHANGED**

remesh has been changed between calls to nag\_pde\_parab\_1d\_keller\_ode\_remesh (d03prc).

## NE SING JAC

Singular Jacobian of ODE system. Check problem formulation.

# NE USER STOP

In evaluating residual of ODE system, **ires** = 2 has been set in **pdedef**, **bndary**, or **odedef**. Integration is successful as far as **ts**:  $\mathbf{ts} = \langle value \rangle$ .

## **NE ZERO WTS**

Zero error weights encountered during time integration.

# 7 Accuracy

nag\_pde\_parab\_1d\_keller\_ode\_remesh (d03prc) controls the accuracy of the integration in the time direction but not the accuracy of the approximation in space. The spatial accuracy depends on both the number of mesh points and on their distribution in space. In the time integration only the local error over a single step is controlled and so the accuracy over a number of steps cannot be guaranteed. You should therefore test the effect of varying the accuracy arguments, **atol** and **rtol**.

# 8 Parallelism and Performance

nag\_pde\_parab\_1d\_keller\_ode\_remesh (d03prc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

nag\_pde\_parab\_1d\_keller\_ode\_remesh (d03prc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the x06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Notefor your implementation for any additional implementation-specific information.

d03prc.22 Mark 26

#### **9** Further Comments

The Keller box scheme can be used to solve higher-order problems which have been reduced to first-order by the introduction of new variables (see the example in Section 10). In general, a second-order problem can be solved with slightly greater accuracy using the Keller box scheme instead of a finite difference scheme (nag\_pde\_parab\_1d\_fd\_ode\_remesh (d03ppc) for example), but at the expense of increased CPU time due to the larger number of function evaluations required.

It should be noted that the Keller box scheme, in common with other central-difference schemes, may be unsuitable for some hyperbolic first-order problems such as the apparently simple linear advection equation  $U_t + aU_x = 0$ , where a is a constant, resulting in spurious oscillations due to the lack of dissipation. This type of problem requires a discretization scheme with upwind weighting (nag\_pde\_parab\_1d\_cd\_ode\_remesh (d03psc) for example), or the addition of a second-order artificial dissipation term.

The time taken depends on the complexity of the system, the accuracy requested, and the frequency of the mesh updates. For a given system with fixed accuracy and mesh-update frequency it is approximately proportional to **neqn**.

# 10 Example

This example is the first-order system

$$\frac{\partial U_1}{\partial t} + \frac{\partial U_1}{\partial x} + \frac{\partial U_2}{\partial x} = 0,$$

$$\frac{\partial U_2}{\partial t} + 4 \frac{\partial U_1}{\partial x} + \frac{\partial U_2}{\partial x} \quad = \quad 0,$$

for  $x \in [0,1]$  and  $t \ge 0$ .

The initial conditions are

$$U_1(x,0) = e^x,$$
  
 $U_2(x,0) = x^2 + \sin(2\pi x^2),$ 

and the Dirichlet boundary conditions for  $U_1$  at x=0 and  $U_2$  at x=1 are given by the exact solution:

$$\begin{array}{rcl} U_1(x,t) & = & \frac{1}{2} \left\{ e^{x+t} + e^{x-3t} \right\} + \frac{1}{4} \left\{ \sin \left( 2\pi (x-3t)^2 \right) - \sin \left( 2\pi (x+t)^2 \right) \right\} + 2t^2 - 2xt, \\ U_2(x,t) & = & e^{x-3t} - e^{x+t} + \frac{1}{2} \left\{ \sin \left( 2\pi (x-3t)^2 \right) + \sin \left( 2\pi (x+t)^2 \right) \right\} + x^2 + 5t^2 - 2xt. \end{array}$$
