

# NAG Library Function Document

## nag\_dmin\_val (f16jpc)

### 1 Purpose

nag\_dmin\_val (f16jpc) computes the smallest component of a real vector, along with the index of that component.

### 2 Specification

```
#include <nag.h>
#include <nagf16.h>
void nag_dmin_val (Integer n, const double x[], Integer incx, Integer *k,
                    double *r, NagError *fail)
```

### 3 Description

nag\_dmin\_val (f16jpc) computes the smallest component,  $r$ , of an  $n$ -element real vector  $x$ , and determines the smallest index,  $k$ , such that

$$r = x_k = \min_j x_j.$$

### 5 Arguments

- |    |  |               |
|----|--|---------------|
| 1: | <b>n</b> – Integer   | <i>Input</i>  |
|    | <i>On entry:</i> $n$ , the number of elements in $x$ .   |               |
|    | <i>Constraint:</i> $n \geq 0$ .  |               |
| 2: | <b>x[dim]</b> – const double   | <i>Input</i>  |
|    | <b>Note:</b> the dimension, $dim$ , of the array <b>x</b> must be at least $\max(1, 1 + (n - 1) \times  \text{incx} )$ .   |               |
|    | <i>On entry:</i> the $n$ -element vector $x$ .   |               |
|    | If <b>incx</b> > 0, $x_i$ must be stored in <b>x</b> [( $i - 1$ ) $\times$ <b>incx</b> ], for $i = 1, 2, \dots, n$ .   |               |
|    | If <b>incx</b> < 0, $x_i$ must be stored in <b>x</b> [( $n - i$ ) $\times$ <b>incx</b> ]], for $i = 1, 2, \dots, n$ .  |               |
|    | Intermediate elements of <b>x</b> are not referenced. If <b>n</b> = 0, <b>x</b> is not referenced and may be NULL.   |               |
| 3: | <b>incx</b> – Integer  | <i>Input</i>  |
|    | <i>On entry:</i> the increment in the subscripts of <b>x</b> between successive elements of $x$ .  |               |
|    | <i>Constraint:</i> <b>incx</b> $\neq 0$ .  |               |
| 4: | <b>k</b> – Integer *   | <i>Output</i> |
|    | <i>On exit:</i> $k$ , the index, from the set $\{0, 1, \dots, n - 1\}$ , of the smallest component of $x$ . If <b>n</b> = 0 on input then <b>k</b> is returned as $-1$ . |               |

5: <b>r</b> – double *	<i>Output</i>
	<i>On exit:</i> $r$ , the smallest component of $x$ . If $\mathbf{n} = 0$ on input then $\mathbf{r}$ is returned as 0.0.
6: <b>fail</b> – NagError *	<i>Input/Output</i>
	The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

## 6 Error Indicators and Warnings

### NE\_ALLOC\_FAIL

Dynamic memory allocation failed.

See Section 3.2.1.2 in How to Use the NAG Library and its Documentation for further information.

### NE\_BAD\_PARAM

On entry, argument  $\langle value \rangle$  had an illegal value.

### NE\_INT

On entry,  $\mathbf{incx} = \langle value \rangle$ .

Constraint:  $\mathbf{incx} \neq 0$ .

On entry,  $\mathbf{n} = \langle value \rangle$ .

Constraint:  $\mathbf{n} \geq 0$ .

### NE\_INTERNAL\_ERROR

An unexpected error has been triggered by this function. Please contact NAG.

See Section 3.6.6 in How to Use the NAG Library and its Documentation for further information.

### NE\_NO\_LICENCE

Your licence key may have expired or may not have been installed correctly.

See Section 3.6.5 in How to Use the NAG Library and its Documentation for further information.

## 7 Accuracy

The BLAS standard requires accurate implementations which avoid unnecessary over/underflow (see Section 2.7 of Basic Linear Algebra Subprograms Technical (BLAST) Forum (2001)).

## 8 Parallelism and Performance

`nag_dmin_val` (f16jpc) is not threaded in any implementation.

## 9 Further Comments

None.

## 10 Example

This example computes the smallest component and index of that component for the vector

$$x = (1, 10, 11, -2, 9)^T.$$
