

## NAG Library Function Document

### nag\_glm\_predict (g02gpc)

## 1 Purpose

nag\_glm\_predict (g02gpc) allows prediction from a generalized linear model fit via nag\_glm\_normal (g02gac), nag\_glm\_binomial (g02gbc), nag\_glm\_poisson (g02gcc) or nag\_glm\_gamma (g02gdc).

## 2 Specification

```
#include <nag.h>
#include <nagg02.h>

void nag_glm_predict (Nag_Distributions errfn, Nag_Link link,
Nag_IncludeMean mean, Integer n, const double x[], Integer tdx,
Integer m, const Integer sx[], Integer ip, const double binom_t[],
const double offset[], const double wt[], double scale, double ex_power,
const double b[], const double cov[], Nag_Boolean vfobs, double eta[],
double seeta[], double pred[], double sepred[], NagError *fail)
```

## 3 Description

A generalized linear model consists of the following elements:

- (i) A suitable distribution for the dependent variable  $y$ .
- (ii) A linear model, with linear predictor  $\eta = X\beta$ , where  $X$  is a matrix of independent variables and  $\beta$  a column vector of  $p$  parameters.
- (iii) A link function  $g(\cdot)$  between the expected value of  $y$  and the linear predictor, that is  $E(y) = \mu = g(\eta)$ .

In order to predict from a generalized linear model, that is estimate a value for the dependent variable,  $y$ , given a set of independent variables  $X$ , the matrix  $X$  must be supplied, along with values for the parameters  $\beta$  and their associated variance-covariance matrix,  $C$ . Suitable values for  $\beta$  and  $C$  are usually estimated by first fitting the prediction model to a training dataset with known responses, using for example nag\_glm\_normal (g02gac), nag\_glm\_binomial (g02gbc), nag\_glm\_poisson (g02gcc) or nag\_glm\_gamma (g02gdc). The predicted variable, and its standard error can then be obtained from:

$$\hat{y} = g^{-1}(\eta), \quad \text{se}(\hat{y}) = \sqrt{\left(\frac{\delta g^{-1}(x)}{\delta x}\right)_\eta} \text{se}(\eta) + I_{\text{fobs}} \text{Var}(y)$$

where

$$\eta = o + X\beta, \quad \text{se}(\eta) = \text{diag} \sqrt{X C X^\top},$$

$o$  is a vector of offsets and  $I_{\text{fobs}} = 0$ , if the variance of future observations is not taken into account, and 1 otherwise. Here  $\text{diag } A$  indicates the diagonal elements of matrix  $A$ .

If required, the variance for the  $i$ th future observation,  $\text{Var}(y_i)$ , can be calculated as:

$$\text{Var}(y_i) = \frac{\phi V(\theta)}{w_i}$$

where  $w_i$  is a weight,  $\phi$  is the scale (or dispersion) parameter, and  $V(\theta)$  is the variance function. Both the scale parameter and the variance function depend on the distribution used for the  $y$ , with:

$$\text{Poisson} \quad V(\theta) = \mu_i, \quad \phi = 1$$

$$\text{binomial} \quad V(\theta) = \frac{\mu_i(t_i - \mu_i)}{t_i}, \quad \phi = 1$$

Normal       $V(\theta) = 1$

gamma       $V(\theta) = \mu_i^2$

In the cases of a Normal and gamma error structure, the scale parameter ( $\phi$ ), is supplied by you. This value is usually obtained from the function used to fit the prediction model. In many cases, for a Normal error structure,  $\phi = \hat{\sigma}^2$ , i.e., the estimated variance.

## 5 Arguments

1: **errfn** – Nag\_Distributions *Input*

*On entry:* indicates the distribution used to model the dependent variable,  $y$ .

**errfn** = Nag\_Binomial

The binomial distribution is used.

**errfn** = Nag\_Gamma

The gamma distribution is used.

**errfn** = Nag\_Normal

The Normal (Gaussian) distribution is used.

**errfn** = Nag\_Poisson

The Poisson distribution is used.

*Constraint:* **errfn** = Nag\_Binomial, Nag\_Gamma, Nag\_Normal or Nag\_Poisson.

2: **link** – Nag\_Link *Input*

*On entry:* indicates which link function to be used.

**link** = Nag\_Compl

A complementary log-log link is used.

**link** = Nag\_Expo

An exponent link is used.

**link** = Nag\_Logistic

A logistic link is used.

**link** = Nag\_Iden

An identity link is used.

**link** = Nag\_Log

A log link is used.

**link** = Nag\_Probit

A probit link is used.

**link** = Nag\_Reci

A reciprocal link is used.

**link** = Nag\_Sqrt

A square root link is used.

Details on the functional form of the different links can be found in the g02 Chapter Introduction.

*Constraints:*

if **errfn** = Nag\_Binomial, **link** = Nag\_Compl, Nag\_Logistic or Nag\_Probit;  
otherwise **link** = Nag\_Expo, Nag\_Iden, Nag\_Log, Nag\_Reci or Nag\_Sqrt.

3: **mean** – Nag\_IncludeMean *Input*

*On entry:* indicates if a mean term is to be included.

**mean** = Nag\_MeanInclude

A mean term, intercept, will be included in the model.

**mean** = Nag\_MeanZero

The model will pass through the origin, zero-point.

*Constraint:* **mean** = Nag\_MeanInclude or Nag\_MeanZero.

4: **n** – Integer *Input*

*On entry:*  $n$ , the number of observations.

*Constraint:* **n**  $\geq 1$ .

5: **x[dim]** – const double *Input*

**Note:** the dimension,  $dim$ , of the array **x** must be at least **n**  $\times$  **tdx**.

*On entry:* **x**[( $i - 1$ )  $\times$  **tdx** +  $j - 1$ ] must contain the  $i$ th observation for the  $j$ th independent variable, for  $i = 1, 2, \dots, n$  and  $j = 1, 2, \dots, m$ .

6: **tdx** – Integer *Input*

*On entry:* the stride separating matrix column elements in the array **x**.

*Constraint:* **tdx**  $\geq m$

7: **m** – Integer *Input*

*On entry:*  $m$ , the total number of independent variables.

*Constraint:* **m**  $\geq 1$ .

8: **sx[m]** – const Integer *Input*

*On entry:* indicates which independent variables are to be included in the model.

If **sx**[ $j - 1$ ]  $> 0$ , the  $j$ th independent variable is included in the regression model.

*Constraints:*

**sx**[ $j - 1$ ]  $\geq 0$ , for  $i = 1, 2, \dots, m$ ;

if **mean** = Nag\_MeanInclude, exactly **ip** – 1 values of **sx** must be  $> 0$ ;

if **mean** = Nag\_MeanZero, exactly **ip** values of **sx** must be  $> 0$ .

9: **ip** – Integer *Input*

*On entry:* the number of independent variables in the model, including the mean or intercept if present.

*Constraint:* **ip**  $> 0$ .

10: **binom\_t[n]** – const double *Input*

*On entry:* if **errfn** = Nag\_Binomial, **binom\_t**[ $i - 1$ ] must contain the binomial denominator,  $t_i$ , for the  $i$ th observation.

Otherwise **binom\_t** is not referenced and may be **NULL**.

*Constraint:* if **errfn** = Nag\_Binomial, **binom\_t**[ $i - 1$ ]  $\geq 0.0$ , for  $i = 1, 2, \dots, n$ .

11: **offset[n]** – const double *Input*

*On entry:* if an offset is required then **offset**[ $i - 1$ ] must contain the value of the offset  $o_i$ , for the  $i$ th observation. Otherwise **offset** must be supplied as **NULL**.

12: **wt[n]** – const double *Input*

*On entry:* if weighted estimates are required then **wt**[ $i - 1$ ] must contain the weight,  $\omega_i$  for the  $i$ th observation. Otherwise **wt** must be supplied as **NULL**.

If **wt**[ $i - 1$ ] = 0.0, then the  $i$ th observation is not included in the model, in which case the effective number of observations is the number of observations with positive weights.

If **wt** = **NULL**, then the effective number of observations is  $n$ .

If the variance of future observations is not included in the standard error of the predicted variable, **wt** is not referenced.

*Constraint:* if **wt** is not **NULL** and **vfobs** = Nag\_TRUE, **wt**[ $i - 1$ ]  $\geq 0.0$ , for  $i = 1, 2, \dots, n$ .

13: **scale** – double *Input*

*On entry:* if **errfn** = Nag\_Normal or Nag\_Gamma and **vfobs** = Nag\_TRUE, the scale parameter,  $\phi$ .

Otherwise **scale** is not referenced and  $\phi = 1$ .

*Constraint:* if **errfn** = Nag\_Normal or Nag\_Gamma and **vfobs** = Nag\_TRUE, **scale**  $> 0.0$ .

14: **ex\_power** – double *Input*

*On entry:* if **link** = Nag\_Expo, **ex\_power** must contain the power of the exponential.

If **link**  $\neq$  Nag\_Expo, **ex\_power** is not referenced.

*Constraint:* if **link** = Nag\_Expo, **ex\_power**  $\neq 0.0$ .

15: **b[ip]** – const double *Input*

*On entry:* the model parameters,  $\beta$ .

If **mean** = Nag\_MeanInclude, **b**[0] must contain the mean parameter and **b**[ $i$ ] the coefficient of the variable contained in the  $j$ th independent **x**, where **sx**[ $j - 1$ ] is the  $i$ th positive value in the array **sx**.

If **mean** = Nag\_MeanZero, **b**[ $i - 1$ ] must contain the coefficient of the variable contained in the  $j$ th independent **x**, where **sx**[ $j - 1$ ] is the  $i$ th positive value in the array **sx**.

16: **cov[ip × (ip + 1)/2]** – const double *Input*

*On entry:* the upper triangular part of the variance-covariance matrix,  $C$ , of the model parameters. This matrix should be supplied packed by column, i.e., the covariance between parameters  $\beta_i$  and  $\beta_j$ , that is the values stored in **b**[ $i - 1$ ] and **b**[ $j - 1$ ], should be supplied in **cov**[ $j \times (j - 1)/2 + i - 1$ ], for  $i = 1, 2, \dots, ip$  and  $j = i, \dots, ip$ .

*Constraint:* the matrix represented in **cov** must be a valid variance-covariance matrix.

17: **vfobs** – Nag\_Boolean *Input*

*On entry:* if **vfobs** = Nag\_TRUE, the variance of future observations is included in the standard error of the predicted variable (i.e.,  $I_{fobs} = 1$ ), otherwise  $I_{fobs} = 0$ .

18: **eta[n]** – double *Output*

*On exit:* the linear predictor,  $\eta$ .

19: **seeta[n]** – double *Output*

*On exit:* the standard error of the linear predictor,  $se(\eta)$ .

20: **pred[n]** – double *Output*

*On exit:* the predicted value,  $\hat{y}$ .

21: <b>sepred[n]</b> – double	<i>Output</i>
	<i>On exit:</i> the standard error of the predicted value, $se(\hat{y})$ . If <b>pred</b> [ $i - 1$ ] could not be calculated, then nag_glm_predict (g02gpc) returns <b>fail.code</b> = NE_INVALID_PRED, and <b>sepred</b> [ $i - 1$ ] is set to $-99.0$ .
22: <b>fail</b> – NagError *	<i>Input/Output</i>

The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

## 6 Error Indicators and Warnings

### NE\_ALLOC\_FAIL

Dynamic memory allocation failed.

See Section 3.2.1.2 in How to Use the NAG Library and its Documentation for further information.

### NE\_BAD\_PARAM

On entry, argument  $\langle value \rangle$  had an illegal value.

On entry, the error type and link function combination supplied is invalid.

### NE\_INT

On entry, **ip** =  $\langle value \rangle$ .  
Constraint: **ip** > 0.

On entry, **m** =  $\langle value \rangle$ .  
Constraint: **m**  $\geq 1$ .

On entry, **n** =  $\langle value \rangle$ .  
Constraint: **n**  $\geq 1$ .

### NE\_INT\_2

On entry, **tdx** =  $\langle value \rangle$  and **m** =  $\langle value \rangle$ .  
Constraint: **tdx**  $\geq m$ .

### NE\_INT\_ARRAY\_CONS

On entry, **sx** not consistent with **ip**:  $\langle value \rangle$  values  $> 0$ , expected  $\langle value \rangle$ .

### NE\_INTERNAL\_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.

See Section 3.6.6 in How to Use the NAG Library and its Documentation for further information.

### NE\_INVALID\_PRED

At least one predicted value could not be calculated as required. **sepred** is set to  $-99.0$  for affected predicted values.

### NE\_NO\_LICENCE

Your licence key may have expired or may not have been installed correctly.

See Section 3.6.5 in How to Use the NAG Library and its Documentation for further information.

**NE\_REAL**

On entry, **ex\_power** = 0.0.

On entry, **scale** =  $\langle \text{value} \rangle$ .

Constraint: **scale** > 0.0.

**NE\_REAL\_ARRAY\_CONS**

On entry,  $\text{cov}[i - 1] < 0.0$  for at least one diagonal element:  $i = \langle \text{value} \rangle$ ,  $\text{cov}[i - 1] = \langle \text{value} \rangle$ .

On entry,  $i = \langle \text{value} \rangle$  and **binom\_t**[ $i - 1$ ] =  $\langle \text{value} \rangle$ .

Constraint: **binom\_t**[ $i - 1$ ]  $\geq 0.0$ , for all  $i$ .

On entry,  $i = \langle \text{value} \rangle$  and **wt**[ $i - 1$ ] =  $\langle \text{value} \rangle$ .

Constraint: **wt**[ $i - 1$ ]  $\geq 0.0$ , for all  $i$ .

## 7 Accuracy

Not applicable.

## 8 Parallelism and Performance

`nag_glm_predict` (g02gpc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the x06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

## 9 Further Comments

None.

## 10 Example

The model

$$y = \frac{1}{\beta_1 + \beta_2 x} + \epsilon$$

is fitted to a training dataset with five observations. The resulting model is then used to predict the response for two new observations.
