

## NAG Library Function Document

### nag\_robust\_trimmed\_1var (g07ddc)

#### 1 Purpose

nag\_robust\_trimmed\_1var (g07ddc) calculates the trimmed and Winsorized means of a sample and estimates of the variances of the two means.

#### 2 Specification

```
#include <nag.h>
#include <nagg07.h>

void nag_robust_trimmed_1var (Integer n, const double x[], double alpha,
    double *tmean, double *wmean, double *tvar, double *wvar, Integer *k,
    double sx[], NagError *fail)
```

#### 3 Description

nag\_robust\_trimmed\_1var (g07ddc) calculates the  $\alpha$ -trimmed mean and  $\alpha$ -Winsorized mean for a given  $\alpha$ , as described below.

Let  $x_i$ , for  $i = 1, 2, \dots, n$ , represent the  $n$  sample observations sorted into ascending order. Let  $k = [\alpha n]$  where  $[y]$  represents the integer nearest to  $y$ ; if  $2k = n$  then  $k$  is reduced by 1.

Then the trimmed mean is defined as:

$$\bar{x}_t = \frac{1}{n - 2k} \sum_{i=k+1}^{n-k} x_i,$$

and the Winsorized mean is defined as:

$$\bar{x}_w = \frac{1}{n} \sum_{i=k+1}^{n-k} x_i + (kx_{k+1}) + (kx_{n-k}).$$

nag\_robust\_trimmed\_1var (g07ddc) then calculates the Winsorized variance about the trimmed and Winsorized means respectively and divides by  $n$  to obtain estimates of the variances of the above two means.

Thus we have

$$\text{Estimate of } \text{var}(\bar{x}_t) = \frac{1}{n^2} \sum_{i=k+1}^{n-k} (x_i - \bar{x}_t)^2 + k(x_{k+1} - \bar{x}_t)^2 + k(x_{n-k} - \bar{x}_t)^2$$

and

$$\text{Estimate of } \text{var}(\bar{x}_w) = \frac{1}{n^2} \sum_{i=k+1}^{n-k} (x_i - \bar{x}_w)^2 + k(x_{k+1} - \bar{x}_w)^2 + k(x_{n-k} - \bar{x}_w)^2.$$

## 5 Arguments

- |     |  |                     |
|-----|--|---------------------|
| 1:  | <b>n</b> – Integer   | <i>Input</i>        |
|     | <i>On entry:</i> the number of observations, $n$ .   |                     |
|     | <i>Constraint:</i> $\mathbf{n} \geq 2$ .   |                     |
| 2:  | <b>x[n]</b> – const double   | <i>Input</i>        |
|     | <i>On entry:</i> the sample observations, $x_i$ , for $i = 1, 2, \dots, n$ .                               |                     |
| 3:  | <b>alpha</b> – double  | <i>Input</i>        |
|     | <i>On entry:</i> the proportion of observations to be trimmed at each end of the sorted sample, $\alpha$ . |                     |
|     | <i>Constraint:</i> $0.0 \leq \mathbf{alpha} < 0.5$ .   |                     |
| 4:  | <b>tmean</b> – double *  | <i>Output</i>       |
|     | <i>On exit:</i> the $\alpha$ -trimmed mean, $\bar{x}_t$ .  |                     |
| 5:  | <b>wmean</b> – double *  | <i>Output</i>       |
|     | <i>On exit:</i> the $\alpha$ -Winsorized mean, $\bar{x}_w$ .   |                     |
| 6:  | <b>tvar</b> – double *   | <i>Output</i>       |
|     | <i>On exit:</i> contains an estimate of the variance of the trimmed mean.                                  |                     |
| 7:  | <b>wvar</b> – double *   | <i>Output</i>       |
|     | <i>On exit:</i> contains an estimate of the variance of the Winsorized mean.                               |                     |
| 8:  | <b>k</b> – Integer *   | <i>Output</i>       |
|     | <i>On exit:</i> contains the number of observations trimmed at each end, $k$ .                             |                     |
| 9:  | <b>sx[n]</b> – double  | <i>Output</i>       |
|     | <i>On exit:</i> contains the sample observations sorted into ascending order.                              |                     |
| 10: | <b>fail</b> – NagError *   | <i>Input/Output</i> |
|     | The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).              |                     |

## 6 Error Indicators and Warnings

### NE\_INT\_ARG\_LT

On entry, **n** =  $\langle value \rangle$ .  
 Constraint:  $\mathbf{n} \geq 2$ .

### NE\_INTERNAL\_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

### NE\_REAL\_ARG\_GE

On entry, **alpha** must not be greater than or equal to 0.5: **alpha** =  $\langle value \rangle$ .

**NE\_REAL\_ARG\_LT**

On entry, **alpha** must not be less than 0.0: **alpha** =  $\langle value \rangle$ .

**7 Accuracy**

The results should be accurate to within a small multiple of *machine precision*.

**8 Parallelism and Performance**

nag\_robust\_trimmed\_lvar (g07ddc) is not threaded in any implementation.

**9 Further Comments**

The time taken by nag\_robust\_trimmed\_lvar (g07ddc) is proportional to  $n$ .

**10 Example**

The following program finds the  $\alpha$ -trimmed mean and  $\alpha$ -Winsorized mean for a sample of 16 observations where  $\alpha = 0.15$ . The estimates of the variances of the above two means are also calculated.
