NAG Library Function Document

nag_bessel_i_alpha (s18ejc)

1 Purpose

nag_bessel_i_alpha (s18ejc) returns a sequence of values for the modified Bessel functions $I_{\alpha+n-1}(x)$ or $I_{\alpha-n+1}(x)$ for real x, non-negative $\alpha < 1$ and $n = 1, 2, \ldots, |N| + 1$.

2 Specification

```
#include <nag.h>
#include <nags.h>
void nag_bessel_i_alpha (double x, double a, Integer nl, Complex b[],
     NagError *fail)
```

3 Description

nag_bessel_i_alpha (s18ejc) evaluates a sequence of values for the modified Bessel function of the first kind $I_\alpha(x)$, where x is real and nonzero and α is the order with $0 \leq \alpha < 1$. The $(|N| + 1)$-member sequence is generated for orders $\alpha, \alpha + 1, \ldots, \alpha + N$ when $N \geq 0$. Note that $+$ is replaced by $-$ when $N < 0$. For positive orders the function may also be called with $x = 0$, since $I_q(0) = 0$ when $q > 0$. For negative orders the formula

$$I_{-q}(x) = I_q(x) + \frac{2}{\pi}\sin(\pi q)K_q(x)$$

is used to generate the required sequence.

5 Arguments

1: **x** – double *Input*

On entry: the argument x of the function.

Constraint: if **nl** < 0, **x** $\neq 0.0$.

2: **a** – double *Input*

On entry: the order α of the first member in the required sequence of function values.

Constraint: $0.0 \leq$ **a** < 1.0.

3: **nl** – Integer *Input*

On entry: the value of N.

Constraint: abs(**nl**) ≤ 101.

4: **b**[×] – Complex *Output*

On exit: with **fail.code** = NE_NOERROR or **fail.code** = NW_SOME_PRECISION_LOSS, the required sequence of function values: **b**(n) contains $I_{\alpha+n-1}(x)$ if **nl** ≥ 1 and $I_{\alpha-n+1}(x)$ otherwise, for $n = 1, 2, \ldots,$ abs(**nl**) $+ 1$.

5: **fail** – NagError * *Input/Output*

The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

6 Error Indicators and Warnings

NE_INT

On entry, **nl** = ⟨*value*⟩.
Constraint: abs(**nl**) ≤ 101.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

NE_OVERFLOW_LIKELY

The evaluation has been abandoned due to the likelihood of overflow.

NE_REAL

On entry, **a** = ⟨*value*⟩.
Constraint: 0.0 ≤ **a** < 1.0.

NE_REAL_INT

On entry, **x** = ⟨*value*⟩, **nl** = ⟨*value*⟩.
Constraint: **x** ≠ 0.0 when **nl** < 0.

NE_TERMINATION_FAILURE

The evaluation has been abandoned due to failure to satisfy the termination condition.

NE_TOTAL_PRECISION_LOSS

The evaluation has been abandoned due to total loss of precision.

NW_SOME_PRECISION_LOSS

The evaluation has been completed but some precision has been lost.

7 Accuracy

All constants in the underlying functions are specified to approximately 18 digits of precision. If t denotes the number of digits of precision in the floating-point arithmetic being used, then clearly the maximum number of correct digits in the results obtained is limited by $p = \min(t, 18)$. Because of errors in argument reduction when computing elementary functions inside the underlying functions, the actual number of correct digits is limited, in general, by $p - s$, where $s \approx \max(1, |\log_{10}|x||, |\log_{10}|\alpha||)$ represents the number of digits lost due to the argument reduction. Thus the larger the values of $|x|$ and $|\alpha|$, the less the precision in the result.

8 Parallelism and Performance

nag_bessel_i_alpha (s18ejc) is not threaded in any implementation.

9 Further Comments

None.

10 Example

The example program evaluates $I_0(x), I_1(x), I_2(x)$ and $I_3(x)$ at $x = 0.5$, and prints the results.
