3 Description

nag_bsm_greeks (s30abc) computes the price of a European call (or put) option together with the Greeks or sensitivities, which are the partial derivatives of the option price with respect to certain of the other input parameters, by the Black–Scholes–Merton formula (see Black and Scholes (1973) and Merton (1973)). The annual volatility, σ, risk-free interest rate, r, and dividend yield, q, must be supplied as input. For a given strike price, X, the price of a European call with underlying price, S, and time to expiry, T, is

$$P_{\text{call}} = Se^{-qT}\Phi(d_1) - Xe^{-rT}\Phi(d_2)$$

and the corresponding European put price is

$$P_{\text{put}} = Xe^{-rT}\Phi(-d_2) - Se^{-qT}\Phi(-d_1)$$

and where Φ denotes the cumulative Normal distribution function,

$$\Phi(x) = \frac{1}{\sqrt{2\pi}}\int_{-\infty}^{x} \exp\left(-y^2/2\right)dy$$

and

$$d_1 = \frac{\ln(S/X) + \left(r - q + \sigma^2/2\right)T}{\sigma\sqrt{T}},$$

$$d_2 = d_1 - \sigma\sqrt{T}.$$

The option price $P_{ij} = P\left(X = X_i, T = T_j\right)$ is computed for each strike price in a set X_i, $i = 1, 2, \ldots, m$, and for each expiry time in a set T_j, $j = 1, 2, \ldots, n$.

7 Accuracy

The accuracy of the output is dependent on the accuracy of the cumulative Normal distribution function, Φ. This is evaluated using a rational Chebyshev expansion, chosen so that the maximum relative error in the expansion is of the order of the ***machine precision*** (see nag_cumul_normal (s15abc) and nag_erfc (s15adc)). An accuracy close to ***machine precision*** can generally be expected.

8 Parallelism and Performance

nag_bsm_greeks (s30abc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

Please consult the x06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Notefor your implementation for any additional implementation-specific information.

9 Further Comments

None.

10 Example

This example computes the price of a European put with a time to expiry of 0.7 years, a stock price of 55 and a strike price of 60. The risk-free interest rate is 10% per year and the volatility is 30% per year.
