# NAG Library Function Document

# nag_implementation_separated_details (a00adc)

## 1 Purpose

nag_implementation_separated_details (a00adc) provides information about the version of the NAG C Library in use.

## 2 Specification

```
#include <nag.h>
#include <naga00.h>
void nag_implementation_separated_details (char *impl, char *prec,
     char *pcode, char *mkmaj, char *mkmin, char *hdware, char *opsys,
     char *ccomp, char *fcomp, char *vend, Nag_Boolean *licval)
```

## 3 Description

The NAG C Library is available for use on a number of different computer systems. For each distinct system an implementation of the library is prepared and this implementation is given a unique code. The specifics that define the implementation are: the working precision, the major and minor marks of the NAG C Library, the target hardware and operating system, the compiler used, and the vendor library (if any) that is also required to be linked. nag_implementation_separated_details (a00adc) may be called to return, in separate arguments, these specific details of the NAG C Library implementation that is being used; it also returns whether a valid licence has been found for this implementation. This differs from nag_implementation_details (a00aac) which simply outputs the collected information in a readable form directly to the `stdout` (standard output) stream.

## 4 References

None.

## 5 Arguments

1: **impl** – char * *Output*

*On exit*: the implementation title which usually lists the target platform, operating system and compiler.

2: **prec** – char * *Output*

*On exit*: the working or basic precision of the implementation. Some functions may perform operations in reduced precision or additional precision, but the great majority will perform all operations in basic precision.

3: **pcode** – char * *Output*

*On exit*: the product code for the NAG C Library implementation that is being used. The code has a discernible structure, but it is not necessary to know the details of this structure. The product code can be used to differentiate between individual product licence codes.

4: **mkmaj** – char * *Output*

*On exit*: the major mark of the NAG C Library implementation that is being used.

5: **mkmin** – char * *Output*

*On exit*: the minor mark of the NAG C Library implementation that is being used.

6: **hdware** – char * *Output*

*On exit*: the target hardware for the NAG C Library implementation that is being used.

7: **opsys** – char * *Output*

*On exit*: the target operating system for the NAG C Library implementation that is being used.

8: **ccomp** – char * *Output*

*On exit*: the C compiler used to build the NAG C Library implementation that is being used.

9: **fcomp** – char * *Output*

*On exit*: the Fortran compiler used to build the NAG C Library implementation that is being used.

10: **vend** – char * *Output*

*On exit*: the subsidiary library, if any, that must be linked with the NAG C Library implementation that is being used. If the implementation does not require a subsidiary library then the string

```
'(self-contained)'
```

will be returned in **vend**.

11: **licval** – Nag_Boolean * *Output*

*On exit*: specifies whether or not a valid licence has been found for the NAG C Library implementation that is being used.

## 6 Error Indicators and Warnings

None.

## 7 Accuracy

Not applicable.

## 8 Parallelism and Performance

Not applicable.

## 9 Further Comments

None.

## 10 Example

This example makes a call of nag_implementation_separated_details (a00adc), collects information on the NAG C Library implementation that is being used and prints it out in a form that is similar to the output obtained by a call to nag_implementation_details (a00aac).
