nag_monotonic_intg (e01bhc)

1 Purpose

nag_monotonic_intg (e01bhc) evaluates the definite integral of a piecewise cubic Hermite interpolant over the interval $[a, b]$.

2 Specification

```
#include <nag.h>
#include <nage01.h>
void nag_monotonic_intg (Integer n, const double x[], const double f[],
                         const double d[], double a, double b, double *integral, NagError *fail)
```

3 Description

nag_monotonic_intg (e01bhc) evaluates the definite integral of a piecewise cubic Hermite interpolant, as computed by nag_monotonic_interpolant (e01bec), over the interval $[a, b]$.

If either a or b lies outside the interval from $x[0]$ to $x[n - 1]$, computation of the integral involves extrapolation and a warning is returned.

The function is derived from routine PCHIA in Fritsch (1982).

4 References

Fritsch F N (1982) PCHIP final specifications *Report UCID-30194* Lawrence Livermore National Laboratory

5 Arguments

1: **n** – Integer *Input*

On entry: **n** must be unchanged from the previous call of nag_monotonic_interpolant (e01bec).

2: **x[n]** – const double *Input*

3: **f[n]** – const double *Input*

4: **d[n]** – const double *Input*

On entry: **x**, **f** and **d** must be unchanged from the previous call of nag_monotonic_interpolant (e01bec).

5: **a** – double *Input*

6: **b** – double *Input*

On entry: the interval $[a, b]$ over which integration is to be performed.

7: **integral** – double * *Output*

On exit: the value of the definite integral of the interpolant over the interval $[a, b]$.

8: **fail** – NagError * *Input/Output*

The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

6 Error Indicators and Warnings

NE_INT_ARG_LT

On entry, **n** = *<value>*.

Constraint: **n** ≥ 2.

NE_NOT_MONOTONIC

On entry, $x[r - 1] \geq x[r]$ for $r = <\text{value}> : x[r - 1] = <\text{value}>, x[r] = <\text{value}>$.

The values of $x[r]$, for $r = 0, 1, \dots, n - 1$, are not in strictly increasing order.

NW_INTERVAL_EXTRAPOLATE

On entry, limits **a**, **b** must not be outside interval $[x[0], x[n - 1]]$, **a** = *<value>*, **b** = *<value>*, $x[0] = <\text{value}>$, $x[\text{value}] = <\text{value}>$. Extrapolation was performed to compute the integral. The value returned is therefore unreliable.

7 Accuracy

The computational error in the value returned for **integral** should be negligible in most practical situations.

8 Parallelism and Performance

`nag_monotonic_intg` (e01bhc) is not threaded in any implementation.

9 Further Comments

The time taken by `nag_monotonic_intg` (e01bhc) is approximately proportional to the number of data points included within the interval $[a, b]$.

10 Example

This example program reads in values of **n**, **x**, **f** and **d**. It then reads in pairs of values for **a** and **b**, and evaluates the definite integral of the interpolant over the interval (a, b) until end-of-file is reached.
