# NAG Library Function Document nag\_opt\_check\_2nd\_deriv (e04hdc)

# 1 Purpose

nag\_opt\_check\_2nd\_deriv (e04hdc) checks that a user-supplied function for calculating second derivatives of an objective function is consistent with a user-supplied function for calculating the corresponding first derivatives.

# 2 Specification

# 3 Description

Routines for minimizing a function  $F(x_1, x_2, \ldots, x_n)$  of the variables  $x_1, x_2, \ldots, x_n$  may require you to provide a subroutine to evaluate the second derivatives of F. nag\_opt\_check\_2nd\_deriv (e04hdc) is designed to check the second derivatives calculated by such user-supplied functions. As well as the function to be checked (**hessfun**), you must supply a function (**objfun**) to evaluate the first derivatives, and a point  $x = (x_1, x_2, \ldots, x_n)^T$  at which the checks will be made. Note that nag\_opt\_check\_2nd\_deriv (e04hdc) checks functions of the form required for nag\_opt\_bounds\_2nd\_deriv (e04lbc).

nag\_opt\_check\_2nd\_deriv (e04hdc) first calls **objfun** and **hessfun** to evaluate the first and second derivatives of F at x. The user-supplied Hessian matrix (H, say) is projected onto two orthogonal vectors y and z to give the scalars  $y^THy$  and  $z^THz$  respectively. The same projections of the Hessian matrix are also estimated by finite differences, giving

$$\begin{array}{ll} p = (y^{\mathrm{T}}g(x+hy) - y^{\mathrm{T}}g(x))/h \\ q = (z^{\mathrm{T}}g(x+hz) - z^{\mathrm{T}}g(x))/h \end{array}$$
 and

respectively, where g() denotes the vector of first derivatives at the point in brackets and h is a small positive scalar. If the relative difference between p and  $y^THy$  or between q and  $z^THz$  is judged too large, an error indicator is set.

# 4 References

None.

# 5 Arguments

1: **n** – Integer Input

On entry: the number n of independent variables in the objective function.

Constraint:  $\mathbf{n} \geq 1$ .

e04hdc NAG Library Manual

2: **objfun** – function, supplied by the user

External Function

**objfun** must evaluate the function F(x) and its first derivatives  $\frac{\partial F}{\partial x_j}$  at a specified point. (However, if you do not wish to calculate F or its first derivatives at a particular point, there is the option of setting an argument to cause nag\_opt\_check\_2nd\_deriv (e04hdc) to terminate immediately.)

The specification of objfun is:

void objfun (Integer n, const double x[], double \*objf, double g[],
 Nag\_Comm \*comm)

1:  $\mathbf{n}$  - Integer

Input

On entry: the number n of variables.

2:  $\mathbf{x}[\mathbf{n}]$  – const double

Input

On entry: the point x at which the value of F, or F and the  $\frac{\partial F}{\partial x_i}$ , are required.

3: **objf** – double \*

Output

On exit: objfun must set objf to the value of the objective function F at the current point x. If it is not possible to evaluate F then objfun should assign a negative value to  $\mathbf{comm} \rightarrow \mathbf{flag}$ ;  $\mathbf{nag\_opt\_check\_2nd\_deriv}$  (e04hdc) will then terminate.

4:  $\mathbf{g}[\mathbf{n}]$  – double

Output

On exit: unless **comm** $\rightarrow$ **flag** is reset to a negative number, **objfun** must set  $\mathbf{g}[j-1]$  to the value of the first derivative  $\frac{\partial F}{\partial x_j}$  at the current point x for  $j=1,2,\ldots,n$ .

5: **comm** – Nag Comm \*

Pointer to structure of type Nag Comm; the following members are relevant to objfun.

flag – Integer

Output

On exit: if objfun resets comm—flag to some negative number then nag\_opt\_check\_2nd\_deriv (e04hdc) will terminate immediately with the error indicator NE\_USER\_STOP. If fail is supplied to nag\_opt\_check\_2nd\_deriv (e04hdc) fail.errnum will be set to your setting of comm—flag.

first - Nag Boolean

Input

On entry: will be set to Nag\_TRUE on the first call to **objfun** and Nag\_FALSE for all subsequent calls.

**nf** – Integer

Input

On entry: the number of evaluations of the objective function; this value will be equal to the number of calls made to **objfun** (including the current one).

user - double \*

iuser - Integer \*

**p** – Pointer

The type Pointer will be void \* with a C compiler that defines void \* and char \* otherwise.

Before calling nag\_opt\_check\_2nd\_deriv (e04hdc) these pointers may be allocated memory and initialized with various quantities for use by **objfun** when called from nag\_opt\_check\_2nd\_deriv (e04hdc).

e04hdc.2 Mark 26

**Note**: nag\_opt\_check\_deriv (e04hcc) should be used to check the first derivatives calculated by **objfun** before nag\_opt\_check\_2nd\_deriv (e04hdc) is used to check the second derivatives, since nag\_opt\_check\_2nd\_deriv (e04hdc) assumes that the first derivatives are correct.

3: **hessfun** – function, supplied by the user

External Function

**hessfun** must calculate the second derivatives of F(x) at any point x. (As with **objfun** there is the option of causing nag opt check 2nd deriv (e04hdc) to terminate immediately.)

The specification of hessfun is:

void hessfun (Integer n, const double x[], double h[], double hd[],
 Nag\_Comm \*comm)

1: **n** – Integer Input

On entry: the number n of variables in the objective function.

2:  $\mathbf{x}[\mathbf{n}]$  – const double Input

On entry: the point x at which the second derivatives are required.

3:  $\mathbf{h}[\mathbf{n} \times (\mathbf{n} - \mathbf{1})/2]$  – double Output

This array is allocated internally by nag\_opt\_check\_2nd\_deriv (e04hdc).

On exit: unless  $comm \rightarrow flag$  is reset to a negative number **hessfun** must place the strict lower triangle of the second derivative matrix of F (evaluated at the point x) in h, stored by rows, i.e., set

$$\mathbf{h}[(i-1)(i-2)/2 + j - 1] = \frac{\partial^2 F}{\partial x_i \partial x_j} \bigg|_{x = \mathbf{v}}, \quad \text{for } i = 2, 3, \dots, n; \ j = 1, 2, \dots, i - 1.$$

(The upper triangle is not required because the matrix is symmetric.)

4:  $\mathbf{hd}[\mathbf{n}]$  – double Input/Output

On entry: the value of  $\frac{\partial F}{\partial x_j}$  at the point x, for  $j=1,2,\ldots,n$ . These values may be useful in the evaluation of the second derivatives.

On exit: unless  $comm \rightarrow flag$  is reset to a negative number **hessfun** must place the diagonal elements of the second derivative matrix of F (evaluated at the point x) in hd, i.e., set

$$\mathbf{hd}[j-1] = \left(\frac{\partial^2 F}{\partial x_j^2}\right)_{x=\mathbf{x}}, \quad \text{for } j=1,2,\ldots,n.$$

5: comm - Nag Comm \*

Pointer to structure of type Nag Comm; the following members are relevant to objfun.

flag – Integer Output

On exit: if hessfun resets comm—flag to some negative number then nag\_opt\_ch eck\_2nd\_deriv (e04hdc) will terminate immediately with the error indicator NE\_USER\_STOP. If fail is supplied to nag\_opt\_check\_2nd\_deriv (e04hdc) fail.errnum will be set to your setting of comm—flag.

first – Nag Boolean Input

On entry: will be set to Nag\_TRUE on the first call to **hessfun** and Nag\_FALSE for all subsequent calls.

**nf** – Integer

On entry: the number of evaluations of the objective function; this value will be equal to the number of calls made to **hessfun** (including the current one).

user - double \*
iuser - Integer \*
p - Pointer

The type Pointer will be void \* with a C compiler that defines void \* and char \* otherwise.

Before calling nag\_opt\_check\_2nd\_deriv (e04hdc) these pointers may be allocated memory and initialized with various quantities for use by **hessfun** when called from nag\_opt\_check\_2nd\_deriv (e04hdc).

Note: the array x must not be changed by hessfun.

4:  $\mathbf{x}[\mathbf{n}]$  – const double

Input

On entry:  $\mathbf{x}[j-1]$ , for  $j=1,2,\ldots,n$  must contain the coordinates of a suitable point at which to check the derivatives calculated by **objfun**. 'Obvious' settings, such as 0.0 or 1.0, should not be used since, at such particular points, incorrect terms may take correct values (particularly zero), so that errors could go undetected. Similarly, it is advisable that no two elements of  $\mathbf{x}$  should be the same.

5:  $\mathbf{g}[\mathbf{n}]$  – double

On exit: unless  $\operatorname{comm} \to \operatorname{flag}$  is reset to a negative number  $\operatorname{\mathbf{g}}[j-1]$  contains the value of the first derivative  $\frac{\partial F}{\partial x_j}$  at the point given in x, as calculated by  $\operatorname{\mathbf{objfun}}$  for  $j=1,2,\ldots,n$ .

6:  $hesl[n \times (n-1)/2] - double$ 

Output

On exit: unless  $comm \rightarrow flag$  is reset to a negative number hest contains the strict lower triangle of the second derivative matrix of F, as evaluated by **hessfun** at the point given in x, stored by rows.

7: hesd[n] – double

Output

On exit: unless  $comm \rightarrow flag$  is reset to a negative number hesd contains the diagonal elements of the second derivative matrix of F, as evaluated by hessfun at the point given in x.

8: comm - Nag Comm \*

Input/Output

**Note: comm** is a NAG defined type (see Section 2.3.1.1 in How to Use the NAG Library and its Documentation).

On entry/exit: structure containing pointers for communication to user-supplied functions; see the above description of **objfun** for details. If you do not need to make use of this communication feature the null pointer NAGCOMM\_NULL may be used in the call to nag\_opt\_check\_2nd\_deriv (e04hdc); **comm** will then be declared internally for use in calls to user-supplied functions.

9: **fail** – NagError \*

Input/Output

The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

# 6 Error Indicators and Warnings

#### NE\_ALLOC\_FAIL

Dynamic memory allocation failed.

e04hdc.4 Mark 26

#### **NE DERIV ERRORS**

Large errors were found in the derivatives of the objective function.

#### NE INT ARG LT

```
On entry, \mathbf{n} = \langle value \rangle.
Constraint: \mathbf{n} \geq 1.
```

#### NE USER STOP

User requested termination, user flag value =  $\langle value \rangle$ .

# 7 Accuracy

The error NE DERIV ERRORS is returned if

or 
$$\begin{aligned} |y^{\mathrm{T}}Hy-p| &\geq \sqrt{h} \times (|y^{\mathrm{T}}Hy|+1.0) \\ |z^{\mathrm{T}}Hz-q| &\geq \sqrt{h} \times (|z^{\mathrm{T}}Hz|+1.0) \end{aligned}$$

where h is set equal to  $\sqrt{\epsilon}$  ( $\epsilon$  being the *machine precision* as given by nag\_machine\_precision (X02AJC) and other quantities are as defined in Section 3.

## 8 Parallelism and Performance

nag opt check 2nd deriv (e04hdc) is not threaded in any implementation.

#### **9** Further Comments

nag opt check 2nd deriv (e04hdc) calls hessfun once and objfun three times.

#### 10 Example

Suppose that it is intended to use nag opt bounds 2nd deriv (e04lbc) to minimize

$$F = (x_1 + 10x_2)^2 + 5(x_3 - x_4)^2 + (x_2 - 2x_3)^4 + 10(x_1 - x_4)^4.$$

The following program could be used to check the second derivatives calculated by the required **hessfun** function. (The call of nag\_opt\_check\_2nd\_deriv (e04hdc) is preceded by a call of nag\_opt\_check\_deriv (e04hcc) to check the function **objfun** which calculates the first derivatives.)
