### nag\_zggsvd (f08vnc)

## 1 Purpose

nag\_zggsvd (f08vnc) computes the generalized singular value decomposition (GSVD) of an  $m$  by  $n$  complex matrix  $A$  and a  $p$  by  $n$  complex matrix  $B$ . nag\_zggsvd (f08vnc) is marked as *deprecated* by LAPACK; the replacement routine is nag\_zggsvd3 (f08vqc) which makes better use of level 3 BLAS.

## 3 Description

The generalized singular value decomposition is given by

$$U^H A Q = D_1 \begin{pmatrix} 0 & R \end{pmatrix}, \quad V^H B Q = D_2 \begin{pmatrix} 0 & R \end{pmatrix},$$

where  $U$ ,  $V$  and  $Q$  are unitary matrices. Let  $(k + l)$  be the effective numerical rank of the matrix  $\begin{pmatrix} A \\ B \end{pmatrix}$ , then  $R$  is a  $(k + l)$  by  $(k + l)$  nonsingular upper triangular matrix,  $D_1$  and  $D_2$  are  $m$  by  $(k + l)$  and  $p$  by  $(k + l)$  ‘diagonal’ matrices structured as follows:

if  $m - k - l \geq 0$ ,

$$\begin{aligned} D_1 &= \begin{matrix} & k & l \\ \begin{matrix} & k \\ & l \\ m - k - l \end{matrix} & \begin{pmatrix} I & 0 \\ 0 & C \\ 0 & 0 \end{pmatrix} \end{matrix} \\ D_2 &= \begin{matrix} & k & l \\ \begin{matrix} & l \\ & p - l \end{matrix} & \begin{pmatrix} 0 & S \\ 0 & 0 \end{pmatrix} \end{matrix} \\ \begin{pmatrix} 0 & R \end{pmatrix} &= \begin{matrix} & n - k - l & k & l \\ \begin{matrix} & 0 \\ & 0 \end{matrix} & \begin{pmatrix} R_{11} & R_{12} \\ 0 & R_{22} \end{pmatrix} \end{matrix} \end{aligned}$$

where

$$C = \text{diag}(\alpha_{k+1}, \dots, \alpha_{k+l}),$$

$$S = \text{diag}(\beta_{k+1}, \dots, \beta_{k+l}),$$

and

$$C^2 + S^2 = I.$$

$R$  is stored as a submatrix of  $A$  with elements  $R_{ij}$  stored as  $A_{i,n-k-l+j}$  on exit.

If  $m - k - l < 0$ ,

$$D_1 = \frac{k}{m-k} \begin{pmatrix} I & 0 & 0 \\ 0 & C & 0 \end{pmatrix}$$

$$D_2 = \frac{m-k}{k+l-m} \begin{pmatrix} k & m-k & k+l-m \\ 0 & S & 0 \\ 0 & 0 & I \\ p-l & 0 & 0 \end{pmatrix}$$

$$(0 \quad R) = \frac{k}{m-k} \begin{pmatrix} n-k-l & k & m-k & k+l-m \\ 0 & R_{11} & R_{12} & R_{13} \\ 0 & 0 & R_{22} & R_{23} \\ 0 & 0 & 0 & R_{33} \end{pmatrix}_{k+l-m}$$

where

$$C = \text{diag}(\alpha_{k+1}, \dots, \alpha_m),$$

$$S = \text{diag}(\beta_{k+1}, \dots, \beta_m),$$

and

$$C^2 + S^2 = I.$$

$\begin{pmatrix} R_{11} & R_{12} & R_{13} \\ 0 & R_{22} & R_{23} \end{pmatrix}$  is stored as a submatrix of  $A$  with  $R_{ij}$  stored as  $A_{i,n-k-l+j}$ , and  $R_{33}$  is stored as a submatrix of  $B$  with  $(R_{33})_{ij}$  stored as  $B_{m-k+i,n+m-k-l+j}$ .

The function computes  $C$ ,  $S$ ,  $R$  and, optionally, the unitary transformation matrices  $U$ ,  $V$  and  $Q$ .

In particular, if  $B$  is an  $n$  by  $n$  nonsingular matrix, then the GSVD of  $A$  and  $B$  implicitly gives the SVD of  $A \times B^{-1}$ :

$$AB^{-1} = U(D_1 D_2^{-1})V^H.$$

If  $\begin{pmatrix} A \\ B \end{pmatrix}$  has orthonormal columns, then the GSVD of  $A$  and  $B$  is also equal to the CS decomposition of  $A$  and  $B$ . Furthermore, the GSVD can be used to derive the solution of the eigenvalue problem:

$$A^H Ax = \lambda B^H Bx.$$

In some literature, the GSVD of  $A$  and  $B$  is presented in the form

$$U^H AX = (0 \quad D_1), \quad V^H BX = (0 \quad D_2),$$

where  $U$  and  $V$  are orthogonal and  $X$  is nonsingular, and  $D_1$  and  $D_2$  are ‘diagonal’. The former GSVD form can be converted to the latter form by taking the nonsingular matrix  $X$  as

$$X = Q \begin{pmatrix} I & 0 \\ 0 & R^{-1} \end{pmatrix}.$$

## NE\_INTERNAL\_ERROR

## NE\_NO\_LICENCE

 See Section 2.7.5 in How to Use the NAG Library and its Documentation for further information.

## 7 Accuracy

The computed generalized singular value decomposition is nearly the exact generalized singular value decomposition for nearby matrices  $(A + E)$  and  $(B + F)$ , where

$$\|E\|_2 = O(\epsilon)\|A\|_2 \text{ and } \|F\|_2 = O(\epsilon)\|B\|_2,$$

and  $\epsilon$  is the *machine precision*. See Section 4.12 of Anderson *et al.* (1999) for further details.

## 8 Parallelism and Performance

nag\_zggsvd (f08vnc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the x06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

## 9 Further Comments

The diagonal elements of the matrix  $R$  are real.

The real analogue of this function is nag\_dggsvd (f08vac).

## 10 Example

This example finds the generalized singular value decomposition

$$A = U\Sigma_1 \begin{pmatrix} 0 & R \end{pmatrix} Q^H, \quad B = V\Sigma_2 \begin{pmatrix} 0 & R \end{pmatrix} Q^H,$$

where

$$A = \begin{pmatrix} 0.96 - 0.81i & -0.03 + 0.96i & -0.91 + 2.06i & -0.05 + 0.41i \\ -0.98 + 1.98i & -1.20 + 0.19i & -0.66 + 0.42i & -0.81 + 0.56i \\ 0.62 - 0.46i & 1.01 + 0.02i & 0.63 - 0.17i & -1.11 + 0.60i \\ 0.37 + 0.38i & 0.19 - 0.54i & -0.98 - 0.36i & 0.22 - 0.20i \\ 0.83 + 0.51i & 0.20 + 0.01i & -0.17 - 0.46i & 1.47 + 1.59i \\ 1.08 - 0.28i & 0.20 - 0.12i & -0.07 + 1.23i & 0.26 + 0.26i \end{pmatrix}$$

and

$$B = \begin{pmatrix} 1 & 0 & -1 & 0 \\ 0 & 1 & 0 & -1 \end{pmatrix},$$

together with estimates for the condition number of  $R$  and the error bound for the computed generalized singular values.

The example program assumes that  $m \geq n$ , and would need slight modification if this is not the case.
