

NAG Library Function Document

nag_sparse_nsym_matvec (f11xac)

1 Purpose

`nag_sparse_nsym_matvec` (f11xac) computes a matrix-vector or transposed matrix-vector product involving a real sparse nonsymmetric matrix stored in coordinate storage format.

2 Specification

```
#include <nag.h>
#include <nagf11.h>
void nag_sparse_nsym_matvec (Nag_TransType trans, Integer n, Integer nnz,
    const double a[], const Integer irow[], const Integer icol[],
    Nag_SparseNsym_CheckData check, const double x[], double y[],
    NagError *fail)
```

3 Description

`nag_sparse_nsym_matvec` (f11xac) computes either the matrix-vector product $y = Ax$, or the transposed matrix-vector product $y = A^T x$, according to the value of the argument **trans**, where A is an n by n sparse nonsymmetric matrix, of arbitrary sparsity pattern. The matrix A is stored in coordinate storage (CS) format (see Section 2.1.1 in the f11 Chapter Introduction). The array **a** stores all nonzero elements of A , while arrays **irow** and **icol** store the corresponding row and column indices respectively.

It is envisaged that a common use of `nag_sparse_nsym_matvec` (f11xac) will be to compute the matrix-vector product required in the application of `nag_sparse_nsym_basic_solver` (f11bec) to sparse linear systems. An illustration of this usage appears in Section 10 in `nag_sparse_nsym_precon_ssor_solve` (f11ddc).

4 References

None.

5 Arguments

- | | | |
|----|--|--------------|
| 1: | trans – Nag_TransType | <i>Input</i> |
| | <i>On entry</i> : specifies whether or not the matrix A is transposed. | |
| | trans = Nag_NoTrans | |
| | $y = Ax$ is computed. | |
| | trans = Nag_Trans | |
| | $y = A^T x$ is computed. | |
| | <i>Constraint</i> : trans = Nag_NoTrans or Nag_Trans. | |
| 2: | n – Integer | <i>Input</i> |
| | <i>On entry</i> : n , the order of the matrix A . | |
| | <i>Constraint</i> : n ≥ 1 . | |

3:	nnz – Integer	<i>Input</i>
<i>On entry:</i> the number of nonzero elements in the matrix A .		
<i>Constraint:</i> $1 \leq \text{nnz} \leq \mathbf{n}^2$.		
4:	a[nnz] – const double	<i>Input</i>
<i>On entry:</i> the nonzero elements in the matrix A , ordered by increasing row index, and by increasing column index within each row. Multiple entries for the same row and column indices are not permitted. The function nag_sparse_nsym_sort (f11zac) may be used to order the elements in this way.		
5:	irow[nnz] – const Integer	<i>Input</i>
6:	icol[nnz] – const Integer	<i>Input</i>
<i>On entry:</i> the row and column indices of the nonzero elements supplied in array a .		
<i>Constraints:</i>		
irow and icol must satisfy the following constraints (which may be imposed by a call to nag_sparse_nsym_sort (f11zac)):		
$1 \leq \text{irow}[i] \leq \mathbf{n}$ and $1 \leq \text{icol}[i] \leq \mathbf{n}$, for $i = 0, 1, \dots, \text{nnz} - 1$;		
$\text{irow}[i - 1] < \text{irow}[i]$ or $\text{irow}[i - 1] = \text{irow}[i]$ and $\text{icol}[i - 1] < \text{icol}[i]$, for $i = 1, 2, \dots, \text{nnz} - 1$.		
7:	check – Nag_SparseNsym_CheckData	<i>Input</i>
<i>On entry:</i> specifies whether or not the CS representation of the matrix A , values of n , nnz , irow and icol should be checked.		
check = Nag_SparseNsym_Check		
Checks are carried on the values of n , nnz , irow and icol .		
check = Nag_SparseNsym_NoCheck		
None of these checks are carried out.		
See also Section 9.2.		
<i>Constraint:</i> check = Nag_SparseNsym_Check or Nag_SparseNsym_NoCheck.		
8:	x[n] – const double	<i>Input</i>
<i>On entry:</i> the vector x .		
9:	y[n] – double	<i>Output</i>
<i>On exit:</i> the vector y .		
10:	fail – NagError *	<i>Input/Output</i>
The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).		

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.

See Section 2.3.1.2 in How to Use the NAG Library and its Documentation for further information.

NE_BAD_PARAM

On entry, argument $\langle\text{value}\rangle$ had an illegal value.

NE_INT

On entry, $\mathbf{n} = \langle \text{value} \rangle$.

Constraint: $\mathbf{n} \geq 1$.

On entry, $\mathbf{nnz} = \langle \text{value} \rangle$.

Constraint: $\mathbf{nnz} \geq 1$.

NE_INT_2

On entry, $\mathbf{nnz} = \langle \text{value} \rangle$ and $\mathbf{n} = \langle \text{value} \rangle$.

Constraint: $\mathbf{nnz} \leq \mathbf{n}^2$.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.

See Section 2.7.6 in How to Use the NAG Library and its Documentation for further information.

NE_INVALID_CS

On entry, $i = \langle \text{value} \rangle$, $\mathbf{icol}[i - 1] = \langle \text{value} \rangle$ and $\mathbf{n} = \langle \text{value} \rangle$.

Constraint: $\mathbf{icol}[i - 1] \geq 1$ and $\mathbf{icol}[i - 1] \leq \mathbf{n}$.

On entry, $i = \langle \text{value} \rangle$, $\mathbf{irow}[i - 1] = \langle \text{value} \rangle$ and $\mathbf{n} = \langle \text{value} \rangle$.

Constraint: $\mathbf{irow}[i - 1] \geq 1$ and $\mathbf{irow}[i - 1] \leq \mathbf{n}$.

NE_NO_LICENCE

Your licence key may have expired or may not have been installed correctly.

See Section 2.7.5 in How to Use the NAG Library and its Documentation for further information.

NE_NOT_STRICTLY_INCREASING

On entry, $\mathbf{a}[i - 1]$ is out of order: $i = \langle \text{value} \rangle$.

On entry, the location $(\mathbf{irow}[I - 1], \mathbf{icol}[I - 1])$ is a duplicate: $I = \langle \text{value} \rangle$. Consider calling nag_sparse_nsym_sort (f11zac) to reorder and sum or remove duplicates.

7 Accuracy

The computed vector y satisfies the error bound:

$$\|y - Ax\|_{\infty} \leq c(n)\epsilon\|A\|_{\infty}\|x\|_{\infty}, \text{ if } \mathbf{trans} = \text{Nag_NoTrans}, \text{ or}$$

$$\|y - A^T x\|_{\infty} \leq c(n)\epsilon\|A^T\|_{\infty}\|x\|_{\infty}, \text{ if } \mathbf{trans} = \text{Nag_Trans},$$

where $c(n)$ is a modest linear function of n , and ϵ is the *machine precision*.

8 Parallelism and Performance

nag_sparse_nsym_matvec (f11xac) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

nag_sparse_nsym_matvec (f11xac) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the x06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

9.1 Timing

The time taken for a call to nag_sparse_nsym_matvec (f11xac) is proportional to **nnz**.

9.2 Use of check

It is expected that a common use of nag_sparse_nsym_matvec (f11xac) will be to compute the matrix-vector product required in the application of nag_sparse_nsym_basic_solver (f11bec) to sparse linear systems. In this situation nag_sparse_nsym_matvec (f11xac) is likely to be called many times with the same matrix A . In the interests of both reliability and efficiency you are recommended to set **check** = Nag_SparseNsym_Check for the first of such calls, and to set **check** = Nag_SparseNsym_NoCheck for all subsequent calls.

10 Example

This example reads in a sparse matrix A and a vector x . It then calls nag_sparse_nsym_matvec (f11xac) to compute the matrix-vector product $y = Ax$ and the transposed matrix-vector product $y = A^T x$.
