

NAG Library Function Document

nag_sparse_herm_matvec (f11xsc)

1 Purpose

nag_sparse_herm_matvec (f11xsc) computes a matrix-vector product involving a complex sparse Hermitian matrix stored in symmetric coordinate storage format.

2 Specification

```
#include <nag.h>
#include <nagf11.h>

void nag_sparse_herm_matvec (Integer n, Integer nnz, const Complex a[],
    const Integer irow[], const Integer icol[],
    Nag_SparseSym_CheckData check, const Complex x[], Complex y[],
    NagError *fail)
```

3 Description

nag_sparse_herm_matvec (f11xsc) computes the matrix-vector product

$$y = Ax$$

where A is an n by n complex Hermitian sparse matrix, of arbitrary sparsity pattern, stored in symmetric coordinate storage (SCS) format (see Section 2.1.2 in the f11 Chapter Introduction). The array **a** stores all the nonzero elements in the lower triangular part of A , while arrays **irow** and **icol** store the corresponding row and column indices respectively.

4 References

None.

5 Arguments

- | | | |
|----|--|--------------|
| 1: | n – Integer
<i>On entry:</i> n , the order of the matrix A .
<i>Constraint:</i> $n \geq 1$. | <i>Input</i> |
| 2: | nnz – Integer
<i>On entry:</i> the number of nonzero elements in the lower triangular part of the matrix A .
<i>Constraint:</i> $1 \leq \mathbf{nnz} \leq \mathbf{n} \times (\mathbf{n} + 1)/2$. | <i>Input</i> |
| 3: | a[nnz] – const Complex
<i>On entry:</i> the nonzero elements in the lower triangular part of the matrix A , ordered by increasing row index, and by increasing column index within each row. Multiple entries for the same row and column indices are not permitted. The function nag_sparse_herm_sort (f11zpc) may be used to order the elements in this way. | <i>Input</i> |
| 4: | irow[nnz] – const Integer | <i>Input</i> |
| 5: | icol[nnz] – const Integer
<i>On entry:</i> the row and column indices of the nonzero elements supplied in array a . | <i>Input</i> |

Constraints:

irow and **icol** must satisfy the following constraints (which may be imposed by a call to `nag_sparse_herm_sort` (f11zpc)):

$$1 \leq \mathbf{irow}[i] \leq \mathbf{n} \text{ and } 1 \leq \mathbf{icol}[i] \leq \mathbf{irow}[i], \text{ for } i = 0, 1, \dots, \mathbf{nnz} - 1;$$

$$\mathbf{irow}[i - 1] < \mathbf{irow}[i] \text{ or } \mathbf{irow}[i - 1] = \mathbf{irow}[i] \text{ and } \mathbf{icol}[i - 1] < \mathbf{icol}[i], \text{ for } i = 1, 2, \dots, \mathbf{nnz} - 1.$$

6: **check** – Nag_SparseSym_CheckData *Input*

On entry: specifies whether or not the SCS representation of the matrix A , values of **n**, **nnz**, **irow** and **icol** should be checked.

check = Nag_SparseSym_Check

Checks are carried out on the values of **n**, **nnz**, **irow** and **icol**.

check = Nag_SparseSym_NoCheck

None of these checks are carried out.

Constraint: **check** = Nag_SparseSym_Check or Nag_SparseSym_NoCheck.

7: **x[n]** – const Complex *Input*

On entry: the vector x .

8: **y[n]** – Complex *Output*

On exit: the vector y .

9: **fail** – NagError * *Input/Output*

The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.

See Section 2.3.1.2 in How to Use the NAG Library and its Documentation for further information.

NE_BAD_PARAM

On entry, argument $\langle value \rangle$ had an illegal value.

NE_INT

On entry, **n** = $\langle value \rangle$.

Constraint: **n** \geq 1.

On entry, **nnz** = $\langle value \rangle$.

Constraint: **nnz** \geq 1.

NE_INT_2

On entry, **nnz** = $\langle value \rangle$ and **n** = $\langle value \rangle$.

Constraint: **nnz** \leq **n** \times (**n** + 1)/2.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.
See Section 2.7.6 in How to Use the NAG Library and its Documentation for further information.

NE_INVALID_SCS

On entry, $I = \langle value \rangle$, $\mathbf{icol}[I - 1] = \langle value \rangle$ and $\mathbf{irow}[I - 1] = \langle value \rangle$.
Constraint: $\mathbf{icol}[I - 1] \geq 1$ and $\mathbf{icol}[I - 1] \leq \mathbf{irow}[I - 1]$.

On entry, $i = \langle value \rangle$, $\mathbf{irow}[i - 1] = \langle value \rangle$ and $\mathbf{n} = \langle value \rangle$.
Constraint: $\mathbf{irow}[i - 1] \geq 1$ and $\mathbf{irow}[i - 1] \leq \mathbf{n}$.

NE_NO_LICENCE

Your licence key may have expired or may not have been installed correctly.
See Section 2.7.5 in How to Use the NAG Library and its Documentation for further information.

NE_NOT_STRICTLY_INCREASING

On entry, $\mathbf{a}[i - 1]$ is out of order: $i = \langle value \rangle$.

On entry, the location $(\mathbf{irow}[I - 1], \mathbf{icol}[I - 1])$ is a duplicate: $I = \langle value \rangle$. Consider calling `nag_sparse_herm_sort (f11zpc)` to reorder and sum or remove duplicates.

7 Accuracy

The computed vector y satisfies the error bound

$$\|y - Ax\|_{\infty} \leq c(n)\epsilon\|A\|_{\infty}\|x\|_{\infty},$$

where $c(n)$ is a modest linear function of n , and ϵ is the *machine precision*.

8 Parallelism and Performance

`nag_sparse_herm_matvec (f11xsc)` is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

`nag_sparse_herm_matvec (f11xsc)` makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the x06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

9.1 Timing

The time taken for a call to `nag_sparse_herm_matvec (f11xsc)` is proportional to **nnz**.

10 Example

This example reads in a complex sparse Hermitian positive definite matrix A and a vector x . It then calls `nag_sparse_herm_matvec (f11xsc)` to compute the matrix-vector product $y = Ax$.
