NAG Library Function Document

nag_zamin_val (f16jtc)

1 Purpose

nag_zamin_val (f16jtc) computes, with respect to absolute value, the smallest component of a complex vector, along with the index of that component.

2 Specification

```
#include <nag.h>
#include <nagf16.h>
void nag_zamin_val (Integer n, const Complex x[], Integer incx, Integer *k,
     double *r, NagError *fail)
```

3 Description

nag_zamin_val (f16jtc) computes, with respect to absolute value, the smallest component, r, of an n-element complex vector x, and determines the smallest index, k, such that

$$r = |\mathrm{Re}\, x_k| + |\mathrm{Im}\, x_k| = \min_j \big|\mathrm{Re}\, x_j\big| + \big|\mathrm{Im}\, x_j\big|.$$

5 Arguments

1: **n** – Integer *Input*

On entry: n, the number of elements in x.

Constraint: $\mathbf{n} \geq 0$.

2: **x**[dim] – const Complex *Input*

Note: the dimension, *dim*, of the array **x** must be at least $\max(1, 1 + (\mathbf{n} - 1) \times |\mathbf{incx}|)$.

On entry: the n-element vector x.

If $\mathbf{incx} > 0$, x_i must be stored in $\mathbf{x}[(i-1) \times \mathbf{incx}]$, for $i = 1, 2, \ldots, \mathbf{n}$.

If $\mathbf{incx} < 0$, x_i must be stored in $\mathbf{x}[(\mathbf{n} - i) \times |\mathbf{incx}|]$, for $i = 1, 2, \ldots, \mathbf{n}$.

Intermediate elements of **x** are not referenced. If $\mathbf{n} = 0$, **x** is not referenced and may be **NULL**.

3: **incx** – Integer *Input*

On entry: the increment in the subscripts of **x** between successive elements of x.

Constraint: $\mathbf{incx} \neq 0$.

4: **k** – Integer * *Output*

On exit: k, the index, from the set $\{0, 1, \ldots, \mathbf{n} - 1\}$, of the smallest component of x with respect to absolute value. If $\mathbf{n} = 0$ on input then **k** is returned as -1.

5: **r** – double * *Output*

On exit: r, the smallest component of x with respect to absolute value. If $\mathbf{n} = 0$ on input then **r** is returned as 0.0.

6: **fail** – NagError * *Input/Output*

The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.
See Section 2.3.1.2 in How to Use the NAG Library and its Documentation for further information.

NE_BAD_PARAM

On entry, argument ⟨*value*⟩ had an illegal value.

NE_INT

On entry, **incx** = ⟨*value*⟩.
Constraint: **incx** $\neq 0$.

On entry, **n** = ⟨*value*⟩.
Constraint: **n** ≥ 0.

NE_INTERNAL_ERROR

An unexpected error has been triggered by this function. Please contact NAG.
See Section 2.7.6 in How to Use the NAG Library and its Documentation for further information.

NE_NO_LICENCE

Your licence key may have expired or may not have been installed correctly.
See Section 2.7.5 in How to Use the NAG Library and its Documentation for further information.

7 Accuracy

The BLAS standard requires accurate implementations which avoid unnecessary over/underflow (see Section 2.7 of Basic Linear Algebra Subprograms Technical (BLAST) Forum (2001)).

8 Parallelism and Performance

nag_zamin_val (f16jtc) is not threaded in any implementation.

9 Further Comments

None.

10 Example

This example computes the smallest component with respect to absolute value and index of that component for the vector

$$x = (-4 + 2.1i, 3.7 + 4.5i, -6 + 1.2i)^{\mathrm{T}}.$$
