

NAG Library Function Document

nag_dtr_copy (f16qec)

1 Purpose

nag_dtr_copy (f16qec) copies a real triangular matrix.

2 Specification

```
#include <nag.h>
#include <nagf16.h>

void nag_dtr_copy (Nag_OrderType order, Nag_UptoType uplo,
    Nag_TransType trans, Nag_DiagType diag, Integer n, const double a[],
    Integer pda, double b[], Integer pdb, NagError *fail)
```

3 Description

nag_dtr_copy (f16qec) performs the triangular matrix copy operations

$$B \leftarrow A \quad \text{or} \quad B \leftarrow A^T$$

where A and B are n by n real triangular matrices.

5 Arguments

- 1: **order** – Nag_OrderType *Input*
On entry: the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag_RowMajor. See Section 2.3.1.3 in How to Use the NAG Library and its Documentation for a more detailed explanation of the use of this argument.
Constraint: **order** = Nag_RowMajor or Nag_ColMajor.
- 2: **uplo** – Nag_UptoType *Input*
On entry: specifies whether the upper or lower triangular part of A is stored.
uplo = Nag_Upper
The upper triangular part of A is stored.
uplo = Nag_Lower
The lower triangular part of A is stored.
Constraint: **uplo** = Nag_Upper or Nag_Lower.
- 3: **trans** – Nag_TransType *Input*
On entry: specifies the operation to be performed.
trans = Nag_NoTrans
 $B \leftarrow A$.

trans = Nag_Trans or Nag_ConjTrans
 $B \leftarrow A^T$.

Constraint: **trans** = Nag_NoTrans, Nag_Trans or Nag_ConjTrans.

4: **diag** – Nag_DiagType *Input*

On entry: specifies whether A has nonunit or unit diagonal elements.

diag = Nag_NonUnitDiag
The diagonal elements are stored explicitly.

diag = Nag_UnitDiag
The diagonal elements are assumed to be 1 and are not referenced.

Constraint: **diag** = Nag_NonUnitDiag or Nag_UnitDiag.

5: **n** – Integer *Input*

On entry: n , the order of the matrices A and B .

Constraint: **n** ≥ 0 .

6: **a[dim]** – const double *Input*

Note: the dimension, dim , of the array **a** must be at least $\max(1, \mathbf{pda} \times \mathbf{n})$.

On entry: the n by n triangular matrix A .

If **order** = Nag_ColMajor, A_{ij} is stored in $\mathbf{a}[(j - 1) \times \mathbf{pda} + i - 1]$.

If **order** = Nag_RowMajor, A_{ij} is stored in $\mathbf{a}[(i - 1) \times \mathbf{pda} + j - 1]$.

If **uplo** = Nag_Upper, the upper triangular part of A must be stored and the elements of the array below the diagonal are not referenced.

If **uplo** = Nag_Lower, the lower triangular part of A must be stored and the elements of the array above the diagonal are not referenced.

If **diag** = Nag_UnitDiag, the diagonal elements of A are assumed to be 1, and are not referenced.

7: **pda** – Integer *Input*

On entry: the stride separating row or column elements (depending on the value of **order**) of the matrix A in the array **a**.

Constraint: **pda** $\geq \max(1, \mathbf{n})$.

8: **b[dim]** – double *Output*

Note: the dimension, dim , of the array **b** must be at least $\max(1, \mathbf{pdb} \times \mathbf{n})$.

On exit: the n by n triangular matrix B .

If **order** = Nag_ColMajor, B_{ij} is stored in $\mathbf{b}[(j - 1) \times \mathbf{pdb} + i - 1]$.

If **order** = Nag_RowMajor, B_{ij} is stored in $\mathbf{b}[(i - 1) \times \mathbf{pdb} + j - 1]$.

If **uplo** = Nag_Upper and **trans** = Nag_NoTrans or if **uplo** = Nag_Lower and **trans** = Nag_Trans or **trans** = Nag_ConjTrans, B is upper triangular and the elements of the array below the diagonal are not set.

If **uplo** = Nag_Lower and **trans** = Nag_NoTrans or if **uplo** = Nag_Upper and **trans** = Nag_Trans or **trans** = Nag_ConjTrans, B is lower triangular and the elements of the array above the diagonal are not set.

| | |
|---|--------------|
| 9: pdb – Integer | <i>Input</i> |
| <i>On entry:</i> the stride separating row or column elements (depending on the value of order) in the array b . | |
| <i>Constraint:</i> $\mathbf{pdb} \geq \max(1, \mathbf{n})$. | |
| 10: fail – NagError * | |
| <i>Input/Output</i> | |
| The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation). | |

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.

See Section 2.3.1.2 in How to Use the NAG Library and its Documentation for further information.

NE_BAD_PARAM

On entry, argument $\langle\text{value}\rangle$ had an illegal value.

NE_INT

On entry, **n** = $\langle\text{value}\rangle$.

Constraint: $\mathbf{n} \geq 0$.

NE_INT_2

On entry, **pda** = $\langle\text{value}\rangle$, **n** = $\langle\text{value}\rangle$.

Constraint: $\mathbf{pda} \geq \max(1, \mathbf{n})$.

On entry, **pdb** = $\langle\text{value}\rangle$, **n** = $\langle\text{value}\rangle$.

Constraint: $\mathbf{pdb} \geq \max(1, \mathbf{n})$.

NE_INTERNAL_ERROR

An unexpected error has been triggered by this function. Please contact NAG.

See Section 2.7.6 in How to Use the NAG Library and its Documentation for further information.

NE_NO_LICENCE

Your licence key may have expired or may not have been installed correctly.

See Section 2.7.5 in How to Use the NAG Library and its Documentation for further information.

7 Accuracy

The BLAS standard requires accurate implementations which avoid unnecessary over/underflow (see Section 2.7 of Basic Linear Algebra Subprograms Technical (BLAST) Forum (2001)).

8 Parallelism and Performance

`nag_dtr_copy` (f16qec) is not threaded in any implementation.

9 Further Comments

None.

10 Example

This example copys the lower triangular matrix A to B where

$$A = \begin{pmatrix} 1.0 & 0.0 & 0.0 & 0.0 \\ 2.0 & 2.0 & 0.0 & 0.0 \\ 3.0 & 3.0 & 3.0 & 0.0 \\ 4.0 & 4.0 & 4.0 & 4.0 \end{pmatrix}.$$
