## nag\_rand\_field\_fracbm\_generate (g05ztc)

### 1 Purpose

nag\_rand\_field\_fracbm\_generate (g05ztc) produces realizations of a fractional Brownian motion, using the circulant embedding method. The square roots of the eigenvalues of the extended covariance matrix (or embedding matrix) need to be input, and can be calculated using nag\_rand\_field\_1d\_predef\_setup (g05znc).

### 2 Specification

```
#include <nag.h>
#include <nagg05.h>

void nag_rand_field_fracbm_generate (Integer ns, Integer s, Integer m,
    double xmax, double h, const double lam[], double rho, Integer state[],
    double z[], double xx[], NagError *fail)
```

### 3 Description

The functions nag\_rand\_field\_1d\_predef\_setup (g05znc) and nag\_rand\_field\_fracbm\_generate (g05ztc) are used to simulate a fractional Brownian motion process with Hurst argument  $H$  over an interval  $[0, x_{\max}]$ , using a set of equally spaced points. Fractional Brownian motion itself cannot be simulated directly using this method, since it is not a stationary Gaussian random field; however its increments can be simulated like a stationary Gaussian random field. The circulant embedding method is described in the documentation for nag\_rand\_field\_1d\_predef\_setup (g05znc).

nag\_rand\_field\_fracbm\_generate (g05ztc) takes the square roots of the eigenvalues of the embedding matrix as returned by nag\_rand\_field\_1d\_predef\_setup (g05znc) when `cov = Nag_VgmBrownian`, and its size  $M$ , as input and outputs  $S$  realizations of the fractional Brownian motion in  $Z$ .

One of the initialization functions nag\_rand\_init\_repeatable (g05kfc) (for a repeatable sequence if computed sequentially) or nag\_rand\_init\_nonrepeatable (g05kge) (for a non-repeatable sequence) must be called prior to the first call to nag\_rand\_field\_fracbm\_generate (g05ztc).

### 5 Arguments

1: **ns** – Integer *Input*

*On entry:* the number of steps (points) to be generated in realizations of the increments of the fractional Brownian motion. This must be the same value as supplied to nag\_rand\_field\_1d\_predef\_setup (g05znc) when calculating the eigenvalues of the embedding matrix.

**Note:** in the context of fractional Brownian motion, **ns** represents the number of *steps* from a zero starting state. Realizations returned in **z** include this starting state and so **ns + 1** values are returned for each realization.

*Constraint:* **ns**  $\geq$  1.

2: **s** – Integer *Input*

*On entry:* **S**, the number of realizations of the fractional Brownian motion to simulate.

*Constraint:* **s**  $\geq$  1.

3: **m** – Integer *Input*

*On entry:* the size, **M**, of the embedding matrix, as returned by nag\_rand\_field\_1d\_user\_setup (g05zmc) or nag\_rand\_field\_1d\_predef\_setup (g05znc).

*Constraint:* **m**  $\geq$  max(1, 2(**ns** – 1)).

4: **xmax** – double *Input*

*On entry:* the upper bound for the interval over which the fractional Brownian motion is to be simulated, as input to nag\_rand\_field\_1d\_user\_setup (g05zmc) or nag\_rand\_field\_1d\_predef\_setup (g05znc).

*Constraint:* **xmax**  $>$  0.0.

5: **h** – double *Input*

*On entry:* the Hurst parameter, **H**, for the fractional Brownian motion. This must be the same value as supplied to nag\_rand\_field\_1d\_predef\_setup (g05znc) in **params**[0], when the eigenvalues of the embedding matrix were calculated.

*Constraint:* 0.0  $<$  **h**  $<$  1.0.

6: **lam**[**m**] – const double *Input*

*On entry:* contains the square roots of the eigenvalues of the embedding matrix, as returned by nag\_rand\_field\_1d\_user\_setup (g05zmc) or nag\_rand\_field\_1d\_predef\_setup (g05znc).

*Constraint:* **lam**[**i** – 1]  $\geq$  0, for **i** = 1, 2, ..., **m**.

7: **rho** – double *Input*

*On entry:* indicates the scaling of the covariance matrix, as returned by nag\_rand\_field\_1d\_user\_setup (g05zmc) or nag\_rand\_field\_1d\_predef\_setup (g05znc).

*Constraint:* 0.0  $<$  **rho**  $\leq$  1.0.

8: **state**[**dim**] – Integer *Communication Array*

**Note:** the dimension, **dim**, of this array is dictated by the requirements of associated functions that must have been previously called. This array **MUST** be the same array passed as argument **state** in the previous call to nag\_rand\_init\_repeatable (g05kfc) or nag\_rand\_init\_nonrepeatable (g05kgc).

*On entry:* contains information on the selected base generator and its current state.

*On exit:* contains updated information on the state of the generator.

9: **z**[(**ns** + 1)  $\times$  **s**] – double *Output*

*On exit:* contains the realizations of the fractional Brownian motion, **Z**. The **j**th realization, for the **i**th point **xx**[**i** – 1], is stored in **z**[(**j** – 1)  $\times$  (**ns** + 1) + **i** – 1], for **j** = 1, 2, ..., **s** and **i** = 1, 2, ..., **ns** + 1.

10: **xx**[**ns** + 1] – double *Output*

*On exit:* the points at which values of the fractional Brownian motion are output. The first point is always zero, and the subsequent **ns** points represent the equispaced steps towards the last point, **xmax**. Note that in `nag_rand_field_1d_user_setup` (g05zmc) and `nag_rand_field_1d_predef_setup` (g05znc), the returned **ns** sample points are the mid-points of the grid returned in **xx** here.

11: **fail** – NagError \* *Input/Output*

The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

## 6 Error Indicators and Warnings

### NE\_ALLOC\_FAIL

Dynamic memory allocation failed.

See Section 2.3.1.2 in How to Use the NAG Library and its Documentation for further information.

### NE\_BAD\_PARAM

On entry, argument *<value>* had an illegal value.

### NE\_INT

On entry, **ns** = *<value>*.

Constraint: **ns** ≥ 1.

On entry, **s** = *<value>*.

Constraint: **s** ≥ 1.

### NE\_INT\_2

On entry, **m** = *<value>*, and **ns** = *<value>*.

Constraint: **m** ≥ max(1, 2(**ns** – 1)).

### NE\_INTERNAL\_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.

See Section 2.7.6 in How to Use the NAG Library and its Documentation for further information.

### NE\_INVALID\_STATE

On entry, **state** vector has been corrupted or not initialized.

### NE\_NEG\_ELEMENT

On entry, at least one element of **lam** was negative.

Constraint: all elements of **lam** must be non-negative.

### NE\_NO\_LICENCE

Your licence key may have expired or may not have been installed correctly.

See Section 2.7.5 in How to Use the NAG Library and its Documentation for further information.

### NE\_REAL

On entry, **h** = *<value>*.

Constraint: 0.0 < **h** < 1.0.

On entry, **rho** =  $\langle value \rangle$ .  
 Constraint:  $0.0 < \mathbf{rho} \leq 1.0$ .

On entry, **xmax** =  $\langle value \rangle$ .  
 Constraint: **xmax** > 0.0.

## 7 Accuracy

Not applicable.

## 8 Parallelism and Performance

`nag_rand_field_fracbm_generate` (g05ztc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

`nag_rand_field_fracbm_generate` (g05ztc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the x06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

## 9 Further Comments

None.

## 10 Example

This example calls `nag_rand_field_fracbm_generate` (g05ztc) to generate 5 realizations of a fractional Brownian motion over 10 steps from  $x = 0.0$  to  $x = 2.0$  using eigenvalues generated by `nag_rand_field_1d_predef_setup` (g05znc) with `cov = Nag_VgmBrownian`.
