# NAG Library Function Document nag\_triplets\_test (g08ecc)

## 1 Purpose

nag\_triplets\_test (g08ecc) performs the triplets test on a sequence of observations from the interval [0, 1].

# 2 Specification

## 3 Description

nag\_triplets\_test (g08ecc) computes the statistics for performing a triplets test which may be used to investigate deviations from randomness in a sequence,  $x = \{x_i : i = 1, 2, ..., n\}$ , of [0, 1] observations.

An m by m matrix, C, of counts is formed as follows. The element  $c_{jkl}$  of C is the number of triplets  $(x_i, x_{i+1}, x_{i+2})$  for i = 1, 4, 7, ..., n-2, such that

$$\frac{j-1}{m} \le x_i < \frac{j}{m}$$
$$\frac{k-1}{m} \le x_{i+1} < \frac{k}{m}$$
$$\frac{l-1}{m} \le x_{i+2} < \frac{l}{m}.$$

Note that all triplets formed are non-overlapping and are thus independent under the assumption of randomness.

Under the assumption that the sequence is random, the expected number of triplets for each class (i.e., each element of the count matrix) is the same; that is, the triplets should be uniformly distributed over the unit cube  $[0,1]^3$ . Thus the expected number of triplets for each class is just the total number of triplets,  $\sum_{i,k=1}^{m} c_{jkl}$ , divided by the number of classes,  $m^3$ .

The  $\chi^2$  test statistic used to test the hypothesis of randomness is defined as

$$X^{2} = \sum_{i,k,l=1}^{m} \frac{(c_{jkl} - e)^{2}}{e},$$

where  $e = \sum_{j,k,l=1}^{m} c_{jkl}/m^3$  = expected number of triplets in each class.

The use of the  $\chi^2$ -distribution as an approximation to the exact distribution of the test statistic,  $X^2$ , improves as the length of the sequence relative to m increases and hence the expected value, e, increases.

## 5 Arguments

1:  $\mathbf{n}$  - Integer Input

On entry: n, the number of observations.

Constraint:  $n \ge 3$ .

2:  $\mathbf{x}[\mathbf{n}]$  - const double

Input

On entry: the sequence of observations.

Constraint:  $0.0 \le \mathbf{x}[i-1] \le 1.0$ , for i = 1, 2, ..., n.

3: **max\_count** – Integer

Input

On entry: m, the size of the count matrix to be formed.

Constraint:  $max\_count \ge 2$ .

4: **chi** – double \*

Output

On exit: contains the  $\chi^2$  test statistic,  $X^2$ , for testing the null hypothesis of randomness.

5: **df** – double \*

On exit: contains the degrees of freedom for the  $\chi^2$  statistic.

6: **prob** – double \*

Output

On exit: contains the upper tail probability associated with the  $\chi^2$  test statistic, i.e., the significance level.

7: **fail** – NagError \*

Input/Output

The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

## 6 Error Indicators and Warnings

## NE\_ALLOC\_FAIL

Dynamic memory allocation failed.

See Section 2.3.1.2 in How to Use the NAG Library and its Documentation for further information.

#### **NE BAD PARAM**

On entry, argument  $\langle value \rangle$  had an illegal value.

#### NE G08EC CELL

**max\_count** is too large relative to the number of triplets, therefore the expected value for at least one cell is less than or equal to 5.0.

This implies that the  $\chi^2$  distribution may not be a very good approximation to the distribution of

g08ecc.2 Mark 26

the test statistic.

 $max\_count = \langle value \rangle$ , number of triplets =  $\langle value \rangle$  and expected value =  $\langle value \rangle$ . All statistics are returned and may still be of use.

#### **NE G08EC TRIPLETS**

No triplets were found because less than 3 observations were provided in total.

#### NE\_INT

```
On entry, max\_count = \langle value \rangle.
Constraint: max\_count \ge 2.
```

#### NE INT ARG LE

```
On entry, max\_count = \langle value \rangle.
Constraint: max\_count \ge 2.
```

#### NE\_INT\_ARG\_LT

```
On entry, \mathbf{n} = \langle value \rangle. Constraint: \mathbf{n} \geq 3.
```

## NE\_INTERNAL\_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG. See Section 2.7.6 in How to Use the NAG Library and its Documentation for further information.

## NE\_NO\_LICENCE

Your licence key may have expired or may not have been installed correctly. See Section 2.7.5 in How to Use the NAG Library and its Documentation for further information.

#### **NE\_REAL\_ARRAY\_CONS**

```
On entry, at least one element of \mathbf{x} is out of range.
Constraint: 0 \le \mathbf{x}[i-1] \le 1, for i = 1, 2, ..., \mathbf{n}.
```

## 7 Accuracy

The computations are believed to be stable. The computations of **prob** given the values of **chi** and **df** will obtain a relative accuracy of five significant figures for most cases.

#### 8 Parallelism and Performance

nag triplets test (g08ecc) is not threaded in any implementation.

#### **9** Further Comments

The time taken by the function increases with the number of observations n.

# 10 Example

The following program performs the triplets test on 10000 pseudorandom numbers taken from a uniform distribution U(0,1), generated by nag\_rand\_basic (g05sac). nag\_triplets\_test (g08ecc) is called with  $max\_count = 5$ .
