NAG Library Function Document

nag_tsa_multi_part_lag_corr (g13dnc)

1 Purpose

nag_tsa_multi_part_lag_corr (g13dnc) calculates the sample partial lag correlation matrices of a multivariate time series. A set of χ^2-statistics and their significance levels are also returned. A call to nag_tsa_multi_cross_corr (g13dmc) is usually made prior to calling this function in order to calculate the sample cross-correlation matrices.

2 Specification

```
#include <nag.h>
#include <nagg13.h>
void nag_tsa_multi_part_lag_corr (Integer k, Integer n, Integer m,
     const double r0[], const double r[], Integer *maxlag, double parlag[],
     double x[], double pvalue[], NagError *fail)
```

3 Description

Let $W_t = (w_{1t}, w_{2t}, \ldots, w_{kt})^{\mathrm{T}}$, for $t = 1, 2, \ldots, n$, denote n observations of a vector of k time series. The partial lag correlation matrix at lag l, $P(l)$, is defined to be the correlation matrix between W_t and W_{t+l}, after removing the linear dependence on each of the intervening vectors $W_{t+1}, W_{t+2}, \ldots, W_{t+l-1}$. It is the correlation matrix between the residual vectors resulting from the regression of W_{t+l} on the carriers $W_{t+l-1}, \ldots, W_{t+1}$ and the regression of W_t on the same set of carriers; see Heyse and Wei (1985).

$P(l)$ has the following properties.

(i) If W_t follows a vector autoregressive model of order p, then $P(l) = 0$ for $l > p$;

(ii) When $k = 1$, $P(l)$ reduces to the univariate partial autocorrelation at lag l;

(iii) Each element of $P(l)$ is a properly normalized correlation coefficient;

(iv) When $l = 1$, $P(l)$ is equal to the cross-correlation matrix at lag 1 (a natural property which also holds for the univariate partial autocorrelation function).

Sample estimates of the partial lag correlation matrices may be obtained using the recursive algorithm described in Wei (1990). They are calculated up to lag m, which is usually taken to be at most $n/4$. Only the sample cross-correlation matrices ($\hat{R}(l)$, for $l = 0, 1, \ldots, m$) and the standard deviations of the series are required as input to nag_tsa_multi_part_lag_corr (g13dnc). These may be computed by nag_tsa_multi_cross_corr (g13dmc). Under the hypothesis that W_t follows an autoregressive model of order $s - 1$, the elements of the sample partial lag matrix $\hat{P}(s)$, denoted by $\hat{P}_{ij}(s)$, are asymptotically Normally distributed with mean zero and variance $1/n$. In addition the statistic

$$X(s) = n \sum_{i=1}^{k} \sum_{j=1}^{k} \hat{P}_{ij}(s)^2$$

has an asymptotic χ^2-distribution with k^2 degrees of freedom. These quantities, $X(l)$, are useful as a diagnostic aid for determining whether the series follows an autoregressive model and, if so, of what order.

5 Arguments

1: **k** – Integer *Input*

On entry: k, the dimension of the multivariate time series.

Constraint: $\mathbf{k} \geq 1$.

2: **n** – Integer *Input*

On entry: n, the number of observations in each series.

Constraint: $\mathbf{n} \geq 2$.

3: **m** – Integer *Input*

On entry: m, the number of partial lag correlation matrices to be computed. Note this also specifies the number of sample cross-correlation matrices that must be contained in the array **r**.

Constraint: $1 \leq \mathbf{m} < \mathbf{n}$.

4: **r0**[**k** × **k**] – const double *Input*

On entry: the sample cross-correlations at lag zero/standard deviations as provided by nag_tsa_multi_cross_corr (g13dmc), that is, **r0**$[(j-1)k+i-1]$ must contain the (i,j)th element of the sample cross-correlation matrix at lag zero if $i \neq j$ and the standard deviation of $i = j$, for $i = 1, 2, \ldots, k$ and $j = 1, 2, \ldots, k$.

5: **r**[**k** × **k** × **m**] – const double *Input*

On entry: the sample cross-correlations as provided by nag_tsa_multi_cross_corr (g13dmc), that is, **r**$[(l-1)k^2+(j-1)k+i-1]$ must contain the (i,j)th element of the sample cross-correlation at lag l, for $l = 1, 2, \ldots, m$, $i = 1, 2, \ldots, k$ and $j = 1, 2, \ldots, k$, where series j leads series i.

6: **maxlag** – Integer * *Output*

On exit: the maximum lag up to which partial lag correlation matrices (along with χ^2-statistics and their significance levels) have been successfully computed. On a successful exit **maxlag** will equal **m**. If **fail.code** = MATRIX_ILL_CONDITIONED on exit, then **maxlag** will be less than **m**.

7: **parlag**[**k** × **k** × **m**] – double *Input/Output*

On exit: **parlag**$[(l-1)k^2+(j-1)k+i-1]$ contains the (i,j)th element of the sample partial lag correlation matrix at lag l, for $l = 1, 2, \ldots,$ **maxlag**, $i = 1, 2, \ldots, k$ and $j = 1, 2, \ldots, k$.

8: **x**[**m**] – double *Output*

On exit: **x**$[l-1]$ contains the χ^2-statistic at lag l, for $l = 1, 2, \ldots,$ **maxlag**.

9: **pvalue**[**m**] – double *Output*

On exit: **pvalue**$[l-1]$ contains the significance level of the corresponding χ^2-statistic in **x**, for $l = 1, 2, \ldots,$ **maxlag**.

10: **fail** – NagError * *Input/Output*

The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

6 Error Indicators and Warnings

MATRIX_ILL_CONDITIONED

The recursive equations used to compute the partial lag correlation matrices are ill-conditioned (they have been computed up to lag ⟨*value*⟩).

NE_ALLOC_FAIL

Dynamic memory allocation failed.
See Section 2.3.1.2 in How to Use the NAG Library and its Documentation for further information.

NE_BAD_PARAM

On entry, argument ⟨*value*⟩ had an illegal value.

NE_INT

On entry, $\mathbf{k} = \langle value \rangle$.
Constraint: $\mathbf{k} \geq 1$.

On entry, $\mathbf{m} = \langle value \rangle$.
Constraint: $\mathbf{m} \geq 1$.

On entry, $\mathbf{n} = \langle value \rangle$.
Constraint: $\mathbf{n} \geq 2$.

NE_INT_2

On entry, $\mathbf{m} = \langle value \rangle$ and $\mathbf{n} = \langle value \rangle$.
Constraint: $\mathbf{m} < \mathbf{n}$.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.
See Section 2.7.6 in How to Use the NAG Library and its Documentation for further information.

NE_NO_LICENCE

Your licence key may have expired or may not have been installed correctly.
See Section 2.7.5 in How to Use the NAG Library and its Documentation for further information.

7 Accuracy

The accuracy will depend upon the accuracy of the sample cross-correlations.

8 Parallelism and Performance

nag_tsa_multi_part_lag_corr (g13dnc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

nag_tsa_multi_part_lag_corr (g13dnc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the x06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

9 Further Comments

The time taken is roughly proportional to m^2k^3.

If you have calculated the sample cross-correlation matrices in the arrays **r0** and **r**, without calling nag_tsa_multi_cross_corr (g13dmc), then care must be taken to ensure they are supplied as described in Section 5. In particular, for $l \geq 1$, $\hat{R}_{ij}(l)$ must contain the sample cross-correlation coefficient between $w_{i(t-l)}$ and w_{jt}.

The function nag_tsa_multi_auto_corr_part (g13dbc) computes squared partial autocorrelations for a specified number of lags. It may also be used to estimate a sequence of partial autoregression matrices at lags $1, 2, \ldots$ by making repeated calls to the function with the argument **nk** set to $1, 2, \ldots$. The (i, j)th element of the sample partial autoregression matrix at lag l is given by $W(i, j, l)$ when **nk** is set equal to l on entry to nag_tsa_multi_auto_corr_part (g13dbc). Note that this is the 'Yule–Walker' estimate. Unlike the partial lag correlation matrices computed by nag_tsa_multi_part_lag_corr (g13dnc), when W_t follows an autoregressive model of order $s-1$, the elements of the sample partial autoregressive matrix at lag s do not have variance $1/n$, making it very difficult to spot a possible cut-off point. The differences between these matrices are discussed further by Wei (1990).

Note that nag_tsa_multi_auto_corr_part (g13dbc) takes the sample cross-covariance matrices as input whereas this function requires the sample cross-correlation matrices to be input.

10 Example

This example computes the sample partial lag correlation matrices of two time series of length 48, up to lag 10. The matrices, their χ^2-statistics and significance levels and a plot of symbols indicating which elements of the sample partial lag correlation matrices are significant are printed. Three * represent significance at the 0.5% level, two * represent significance at the 1% level and a single * represents significance at the 5% level. The * are plotted above or below the central line depending on whether the elements are significant in a positive or negative direction.
