

# NAG Library Function Document

## nag\_incomplete\_gamma (s14bac)

### 1 Purpose

`nag_incomplete_gamma (s14bac)` computes values for the incomplete gamma functions  $P(a, x)$  and  $Q(a, x)$ .

### 2 Specification

```
#include <nag.h>
#include <nags.h>
void nag_incomplete_gamma (double a, double x, double tol, double *p,
                           double *q, NagError *fail)
```

### 3 Description

`nag_incomplete_gamma (s14bac)` evaluates the incomplete gamma functions in the normalized form

$$P(a, x) = \frac{1}{\Gamma(a)} \int_0^x t^{a-1} e^{-t} dt,$$

$$Q(a, x) = \frac{1}{\Gamma(a)} \int_x^\infty t^{a-1} e^{-t} dt,$$

with  $x \geq 0$  and  $a > 0$ , to a user-specified accuracy. With this normalization,  $P(a, x) + Q(a, x) = 1$ .

Several methods are used to evaluate the functions depending on the arguments  $a$  and  $x$ , the methods including Taylor expansion for  $P(a, x)$ , Legendre's continued fraction for  $Q(a, x)$ , and power series for  $Q(a, x)$ . When both  $a$  and  $x$  are large, and  $a \simeq x$ , the uniform asymptotic expansion of Temme (1987) is employed for greater efficiency – specifically, this expansion is used when  $a \geq 20$  and  $0.7a \leq x \leq 1.4a$ .

Once either  $P$  or  $Q$  is computed, the other is obtained by subtraction from 1. In order to avoid loss of relative precision in this subtraction, the smaller of  $P$  and  $Q$  is computed first.

This function is derived from the function GAM in Gautschi (1979b).

### 5 Arguments

1: **a** – double *Input*

*On entry:* the argument  $a$  of the functions.

*Constraint:*  $a > 0.0$ .

2:	<b>x</b> – double	<i>Input</i>
<i>On entry:</i> the argument $x$ of the functions.		
<i>Constraint:</i> $x \geq 0.0$ .		
3:	<b>tol</b> – double	<i>Input</i>
<i>On entry:</i> the relative accuracy required by you in the results. If nag_incomplete_gamma(s14bac) is entered with <b>tol</b> greater than 1.0 or less than <b>machine precision</b> , then the value of <b>machine precision</b> is used instead.		
4:	<b>p</b> – double *	<i>Output</i>
5:	<b>q</b> – double *	<i>Output</i>
<i>On exit:</i> the values of the functions $P(a, x)$ and $Q(a, x)$ respectively.		
6:	<b>fail</b> – NagError *	<i>Input/Output</i>
The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).		

## 6 Error Indicators and Warnings

### NE\_ALG\_NOT\_CONV

Algorithm fails to terminate in  $\langle value \rangle$  iterations.

### NE\_ALLOC\_FAIL

Dynamic memory allocation failed.

See Section 2.3.1.2 in How to Use the NAG Library and its Documentation for further information.

### NE\_BAD\_PARAM

On entry, argument  $\langle value \rangle$  had an illegal value.

### NE\_INTERNAL\_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.

See Section 2.7.6 in How to Use the NAG Library and its Documentation for further information.

### NE\_NO\_LICENCE

Your licence key may have expired or may not have been installed correctly.

See Section 2.7.5 in How to Use the NAG Library and its Documentation for further information.

### NE\_REAL\_ARG\_LT

On entry,  $a = \langle value \rangle$ .

Constraint:  $a > 0.0$ .

### NE\_REAL\_ARG\_LT

On entry,  $x = \langle value \rangle$ .

Constraint:  $x \geq 0.0$ .

## 7 Accuracy

There are rare occasions when the relative accuracy attained is somewhat less than that specified by argument **tol**. However, the error should never exceed more than one or two decimal places. Note also that there is a limit of 18 decimal places on the achievable accuracy, because constants in the function are given to this precision.

## 8 Parallelism and Performance

`nag_incomplete_gamma` (s14bac) is not threaded in any implementation.

## 9 Further Comments

The time taken for a call of `nag_incomplete_gamma` (s14bac) depends on the precision requested through **tol**, and also varies slightly with the input arguments  $a$  and  $x$ .

## 10 Example

This example reads values of the argument  $a$  and  $x$  from a file, evaluates the function and prints the results.
