

# NAG Library Function Document

## nag\_mesh2d\_bound (d06bac)

### 1 Purpose

nag\_mesh2d\_bound (d06bac) generates a boundary mesh on a closed connected subdomain  $\Omega$  of  $\mathbb{R}^2$ .

### 2 Specification

```
#include <nag.h>
#include <nagd06.h>

void nag_mesh2d_bound (Integer nlines, const double coorch[],
    const Integer lined[],
    double (*fbnd)(Integer i, double x, double y, Nag_Comm *comm),
    const double crus[], Integer sdcrus, const double rate[], Integer ncomp,
    const Integer nlcomp[], const Integer lcomp[], Integer nvmax,
    Integer nedmx, Integer *nvb, double coor[], Integer *nedge,
    Integer edge[], Integer itrace, const char *outfile, Nag_Comm *comm,
    NagError *fail)
```

### 3 Description

Given a closed connected subdomain  $\Omega$  of  $\mathbb{R}^2$ , whose boundary  $\partial\Omega$  is divided by characteristic points into  $m$  distinct line segments, nag\_mesh2d\_bound (d06bac) generates a boundary mesh on  $\partial\Omega$ . Each line segment may be a straight line, a curve defined by the equation  $f(x, y) = 0$ , or a polygonal curve defined by a set of given boundary mesh points.

This function is primarily designed for use with either nag\_mesh2d\_inc (d06aac) (a simple incremental method) or nag\_mesh2d\_delaunay (d06abc) (Delaunay–Voronoi method) or nag\_mesh2d\_front (d06acc) (Advancing Front method) to triangulate the interior of the domain  $\Omega$ . For more details about the boundary and interior mesh generation, consult the d06 Chapter Introduction as well as George and Borouchaki (1998).

This function is derived from material in the MODULEF package from INRIA (Institut National de Recherche en Informatique et Automatique).

### 4 References

George P L and Borouchaki H (1998) *Delaunay Triangulation and Meshing: Application to Finite Elements* Editions HERMES, Paris

### 5 Arguments

1: **nlines** – Integer *Input*

*On entry:*  $m$ , the number of lines that define the boundary of the closed connected subdomain (this equals the number of characteristic points which separate the entire boundary  $\partial\Omega$  into lines).

*Constraint:* **nlines**  $\geq 1$ .

2: **coorch**[ $2 \times \mathbf{nlines}$ ] – const double *Input*

**Note:** the  $(i, j)$ th element of the matrix is stored in **coorch**[( $j - 1$ )  $\times 2 + i - 1$ ].

*On entry:* **coorch**[( $i - 1$ )  $\times 2$ ] contains the  $x$  coordinate of the  $i$ th characteristic point, for  $i = 1, 2, \dots, \mathbf{nlines}$ ; while **coorch**[( $i - 1$ )  $\times 2 + 1$ ] contains the corresponding  $y$  coordinate.

3: **lined**[ $4 \times \mathbf{nlines}$ ] – const Integer Input

**Note:** the  $(i, j)$ th element of the matrix is stored in **lined**[( $j - 1$ )  $\times$  4 +  $i - 1$ ].

*On entry:* the description of the lines that define the boundary domain. The line  $i$ , for  $i = 1, 2, \dots, m$ , is defined as follows:

**lined**[( $i - 1$ )  $\times$  4]

The number of points on the line, including two end points.

**lined**[( $i - 1$ )  $\times$  4 + 1]

The first end point of the line. If **lined**[( $i - 1$ )  $\times$  4 + 1] =  $j$ , then the coordinates of the first end point are those stored in **coorch**[( $j - 1$ )  $\times$  2], **coorch**[( $j - 1$ )  $\times$  2 + 1].

**lined**[( $i - 1$ )  $\times$  4 + 2]

The second end point of the line. If **lined**[( $i - 1$ )  $\times$  4 + 2] =  $k$ , then the coordinates of the second end point are those stored in **coorch**[( $k - 1$ )  $\times$  2], **coorch**[( $k - 1$ )  $\times$  2 + 1].

**lined**[( $i - 1$ )  $\times$  4 + 3]

This defines the type of line segment connecting the end points. Additional information is conveyed by the numerical value of **lined**[( $i - 1$ )  $\times$  4 + 3] as follows:

- (i) **lined**[( $i - 1$ )  $\times$  4 + 3] > 0, the line is described in **fbnd** with **lined**[( $i - 1$ )  $\times$  4 + 3] as the index. In this case, the line must be described in the trigonometric (anticlockwise) direction;
- (ii) **lined**[( $i - 1$ )  $\times$  4 + 3] = 0, the line is a straight line;
- (iii) if **lined**[( $i - 1$ )  $\times$  4 + 3] < 0, say (i.e., **lined**[( $i - 1$ )  $\times$  4 + 3] =  $-p$  for some index  $p$ ), then the line is a polygonal arc joining the end points and interior points specified in **crus**. In this case the line contains the points whose coordinates are stored in **coorch**[( $j - 1$ )  $\times$  2 +  $z$ ], **crus**[( $p - 1$ )  $\times$  2 +  $z$ ], **crus**[ $p \times$  2 +  $z$ ], ..., **crus**[( $p + r - 4$ )  $\times$  2 +  $z$ ], **coorch**[( $k - 1$ )  $\times$  2 +  $z$ ], where  $z \in \{0, 1\}$ ,  $r = \mathbf{lined}[(i - 1) \times 4]$ ,  $j = \mathbf{lined}[(i - 1) \times 4 + 1]$  and  $k = \mathbf{lined}[(i - 1) \times 4 + 2]$ .

*Constraints:*

$$\begin{aligned} 2 &\leq \mathbf{lined}[(i - 1) \times 4]; \\ 1 &\leq \mathbf{lined}[(i - 1) \times 4 + 1] \leq \mathbf{nlines}; \\ 1 &\leq \mathbf{lined}[(i - 1) \times 4 + 2] \leq \mathbf{nlines}; \\ \mathbf{lined}[(i - 1) \times 4 + 1] &\neq \mathbf{lined}[(i - 1) \times 4 + 2], \text{ for } i = 1, 2, \dots, \mathbf{nlines}. \end{aligned}$$

For each line described by **fbnd** (lines with **lined**[( $i - 1$ )  $\times$  4 + 3] > 0, for  $i = 1, 2, \dots, \mathbf{nlines}$ ) the two end points (**lined**[( $i - 1$ )  $\times$  4 + 1] and **lined**[( $i - 1$ )  $\times$  4 + 2]) lie on the curve defined by index **lined**[( $i - 1$ )  $\times$  4 + 3] in **fbnd**, i.e.,

$$\mathbf{fbnd}(\mathbf{lined}[(i - 1) \times 4 + 3], \mathbf{coorch}[(\mathbf{lined}[(i - 1) \times 4 + 1] - 1) \times 2], \mathbf{coorch}[(\mathbf{lined}[(i - 1) \times 4 + 1] - 1) \times 2 + 1], \mathbf{comm}) = 0;$$

$$\mathbf{fbnd}(\mathbf{lined}[(i - 1) \times 4 + 3], \mathbf{coorch}[(\mathbf{lined}[(i - 1) \times 4 + 2] - 1) \times 2], \mathbf{coorch}[(\mathbf{lined}[(i - 1) \times 4 + 2] - 1) \times 2 + 1], \mathbf{comm}) = 0, \text{ for } i = 1, 2, \dots, \mathbf{nlines}.$$

For all lines described as polygonal arcs (lines with **lined**[( $i - 1$ )  $\times$  4 + 3] < 0, for  $i = 1, 2, \dots, \mathbf{nlines}$ ) the sets of intermediate points (i.e.,

$[-\mathbf{lined}[(i - 1) \times 4 + 3] : -\mathbf{lined}[(i - 1) \times 4 + 3] + \mathbf{lined}[(i - 1) \times 4] - 3]$  for all  $i$  such that **lined**[( $i - 1$ )  $\times$  4 + 3] < 0) are not overlapping. This can be expressed as:

$$-\mathbf{lined}[(i - 1) \times 4 + 3] + \mathbf{lined}[(i - 1) \times 4] - 3 = \sum_{\{i, \mathbf{lined}[(i-1) \times 4 + 3] < 0\}} \{\mathbf{lined}[(i - 1) \times 4] - 2\}$$

or

$$-\mathbf{lined}[(i - 1) \times 4 + 3] + \mathbf{lined}[(i - 1) \times 4] - 2 = -\mathbf{lined}[(j - 1) \times 4 + 3],$$

for a  $j$  such that  $j = 1, 2, \dots, \mathbf{nlines}$ ,  $j \neq i$  and **lined**[( $j - 1$ )  $\times$  4 + 3] < 0.

- 4: **fbnd** – function, supplied by the user *External Function*

**fbnd** must be supplied to calculate the value of the function which describes the curve  $\{(x, y) \in \mathbb{R}^2; \text{ such that } f(x, y) = 0\}$  on segments of the boundary for which **lined** $[(i - 1) \times 4 + 3] > 0$ . If there are no boundaries for which **lined** $[(i - 1) \times 4 + 3] > 0$  **fbnd** will never be referenced by nag\_mesh2d\_bound (d06bac), in which case **fbnd** may be **NULLFN**.

The specification of **fbnd** is:

```
double fbnd (Integer i, double x, double y, Nag_Comm *comm)
```

1: **i** – Integer *Input*

*On entry:* **lined** $[3][i - 1]$ , the reference index of the line (portion of the contour) *i* described.

2: **x** – double *Input*

3: **y** – double *Input*

*On entry:* the values of *x* and *y* at which  $f(x, y)$  is to be evaluated.

4: **comm** – Nag\_Comm \*

Pointer to structure of type Nag\_Comm; the following members are relevant to **fbnd**.

**user** – double \*

**iuser** – Integer \*

**p** – Pointer

The type Pointer will be void \*. Before calling nag\_mesh2d\_bound (d06bac) you may allocate memory and initialize these pointers with various quantities for use by **fbnd** when called from nag\_mesh2d\_bound (d06bac) (see Section 2.3.1.1 in How to Use the NAG Library and its Documentation).

- 5: **crus** $[2 \times \text{sdcrus}]$  – const double *Input*

**Note:** the  $(i, j)$ th element of the matrix is stored in **crus** $[(j - 1) \times 2 + i - 1]$ .

*On entry:* the coordinates of the intermediate points for polygonal arc lines. For a line *i* defined as a polygonal arc (i.e., **lined** $[(i - 1) \times 4 + 3] < 0$ ), if  $p = -\text{lined}[(i - 1) \times 4 + 3]$ , then **crus** $[(k - 1) \times 2]$ , for  $k = p, \dots, p + \text{lined}[(i - 1) \times 4] - 3$ , must contain the *x* coordinate of the consecutive intermediate points for this line. Similarly **crus** $[(k - 1) \times 2 + 1]$ , for  $k = p, \dots, p + \text{lined}[(i - 1) \times 4] - 3$ , must contain the corresponding *y* coordinate.

- 6: **sdcrus** – Integer *Input*

*On entry:* the half dimension of the array **crus** as declared in the function from which nag\_mesh2d\_bound (d06bac) is called.

*Constraint:*  $\text{sdcrus} \geq \sum_{\{i, \text{lined}[(i-1) \times 4 + 3] < 0\}} \{\text{lined}[(i - 1) \times 4] - 2\}$ .

- 7: **rate** $[\text{nlines}]$  – const double *Input*

*On entry:* **rate** $[i - 1]$  is the geometric progression ratio between the points to be generated on the line *i*, for  $i = 1, 2, \dots, m$  and **lined** $[(i - 1) \times 4 + 3] \geq 0$ .

If **lined** $[(i - 1) \times 4 + 3] < 0$ , **rate** $[i - 1]$  is not referenced.

*Constraint:* if **lined** $[(i - 1) \times 4 + 3] \geq 0$ , **rate** $[i - 1] > 0.0$ , for  $i = 1, 2, \dots, \text{nlines}$ .

- 8: **ncomp** – Integer *Input*  
*On entry:*  $n$ , the number of separately connected components of the boundary.  
*Constraint:*  $\mathbf{ncomp} \geq 1$ .
- 9: **nlcomp**[**ncomp**] – const Integer *Input*  
*On entry:*  $|\mathbf{nlcomp}[k-1]|$  is the number of line segments in component  $k$  of the contour. The line  $i$  of component  $k$  runs in the direction **lined** $[(i-1) \times 4 + 1]$  to **lined** $[(i-1) \times 4 + 2]$  if  $\mathbf{nlcomp}[k-1] > 0$ , and in the opposite direction otherwise; for  $k = 1, 2, \dots, n$ .  
*Constraints:*  

$$1 \leq |\mathbf{nlcomp}[k-1]| \leq \mathbf{nlines}, \text{ for } k = 1, 2, \dots, \mathbf{ncomp};$$

$$\sum_{k=1}^n |\mathbf{nlcomp}[k-1]| = \mathbf{nlines}.$$
- 10: **lcomp**[**nlines**] – const Integer *Input*  
*On entry:* **lcomp** must contain the list of line numbers for the each component of the boundary. Specifically, the line numbers for the  $k$ th component of the boundary, for  $k = 1, 2, \dots, \mathbf{ncomp}$ , must be in elements  $l1-1$  to  $l2-1$  of **lcomp**, where  $l2 = \sum_{i=1}^k |\mathbf{nlcomp}[i-1]|$  and  $l1 = l2 + 1 - |\mathbf{nlcomp}[k-1]|$ .  
*Constraint:* **lcomp** must hold a valid permutation of the integers  $[1, \mathbf{nlines}]$ .
- 11: **nvmax** – Integer *Input*  
*On entry:* the maximum number of the boundary mesh vertices to be generated.  
*Constraint:*  $\mathbf{nvmax} \geq \mathbf{nlines}$ .
- 12: **nedmx** – Integer *Input*  
*On entry:* the maximum number of boundary edges in the boundary mesh to be generated.  
*Constraint:*  $\mathbf{nedmx} \geq 1$ .
- 13: **nvb** – Integer \* *Output*  
*On exit:* the total number of boundary mesh vertices generated.
- 14: **coor**[ $2 \times \mathbf{nvmax}$ ] – double *Output*  
**Note:** the  $(i, j)$ th element of the matrix is stored in **coor** $[(j-1) \times 2 + i - 1]$ .  
*On exit:* **coor** $[(i-1) \times 2]$  will contain the  $x$  coordinate of the  $i$ th boundary mesh vertex generated, for  $i = 1, 2, \dots, \mathbf{nvb}$ ; while **coor** $[(i-1) \times 2 + 1]$  will contain the corresponding  $y$  coordinate.
- 15: **nedge** – Integer \* *Output*  
*On exit:* the total number of boundary edges in the boundary mesh.
- 16: **edge**[ $3 \times \mathbf{nedmx}$ ] – Integer *Output*  
**Note:** the  $(i, j)$ th element of the matrix is stored in **edge** $[(j-1) \times 3 + i - 1]$ .  
*On exit:* the specification of the boundary edges. **edge** $[(j-1) \times 3]$  and **edge** $[(j-1) \times 3 + 1]$  will contain the vertex numbers of the two end points of the  $j$ th boundary edge. **edge** $[(j-1) \times 3 + 2]$  is a reference number for the  $j$ th boundary edge and

$\mathbf{edge}[(j-1) \times 3 + 2] = \mathbf{lined}[(i-1) \times 4 + 3]$ , where  $i$  and  $j$  are such that the  $j$ th edges is part of the  $i$ th line of the boundary and  $\mathbf{lined}[(i-1) \times 4 + 3] \geq 0$ ;

$\mathbf{edge}[(j-1) \times 3 + 2] = 100 + |\mathbf{lined}[(i-1) \times 4 + 3]|$ , where  $i$  and  $j$  are such that the  $j$ th edges is part of the  $i$ th line of the boundary and  $\mathbf{lined}[(i-1) \times 4 + 3] < 0$ .

Note that the edge vertices are numbered from 1 to **nvb**.

17: **itrace** – Integer *Input*

*On entry:* the level of trace information required from nag\_mesh2d\_bound (d06bac).

**itrace** = 0 or **itrace** < -1

No output is generated.

**itrace** = 1

Output from the boundary mesh generator is printed. This output contains the input information of each line and each connected component of the boundary.

**itrace** = -1

An analysis of the output boundary mesh is printed on the current advisory message unit. This analysis includes the orientation (clockwise or anticlockwise) of each connected component of the boundary. This information could be of interest to you, especially if an interior meshing is carried out using the output of this function, calling either nag\_mesh2d\_inc (d06aac), nag\_mesh2d\_delaunay (d06abc) or nag\_mesh2d\_front (d06acc).

**itrace** > 1

The output is similar to that produced when **itrace** = 1, but the coordinates of the generated vertices on the boundary are also output.

You are advised to set **itrace** = 0, unless you are experienced with finite element mesh generation.

18: **outfile** – const char \* *Input*

*On entry:* the name of a file to which diagnostic output will be directed. If **outfile** is **NULL** the diagnostic output will be directed to standard output.

19: **comm** – Nag\_Comm \*

The NAG communication argument (see Section 2.3.1.1 in How to Use the NAG Library and its Documentation).

20: **fail** – NagError \* *Input/Output*

The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

## 6 Error Indicators and Warnings

### NE\_ALLOC\_FAIL

Dynamic memory allocation failed.

See Section 2.3.1.2 in How to Use the NAG Library and its Documentation for further information.

### NE\_BAD\_PARAM

On entry, argument  $\langle value \rangle$  had an illegal value.

### NE\_INT

On entry, **ncomp** the number of connected components of the boundary is less than 1: **ncomp** =  $\langle value \rangle$ .

On entry, **nedmx** =  $\langle value \rangle$ .

Constraint: **nedmx**  $\geq 1$ .

On entry, **nedmx** the maximum number of boundary edge lines is less than 1: **nedmx** =  $\langle value \rangle$ .

On entry, **nlines** =  $\langle value \rangle$ .

Constraint: **nlines**  $\geq 1$ .

On entry, **nlines** the number of lines is less than 1: **nlines** =  $\langle value \rangle$ .

### NE\_INT\_2

On entry, **nvmax** =  $\langle value \rangle$  and **nlines** =  $\langle value \rangle$ .

Constraint: **nvmax**  $\geq$  **nlines**.

On entry, **nvmax** the maximum number of boundary vertices is less than **nlines**: **nvmax** =  $\langle value \rangle$  and **nlines** =  $\langle value \rangle$ .

On entry, **sdcrus** =  $\langle value \rangle$  and *nusmin* =  $\langle value \rangle$ .

Constraint: **sdcrus**  $\geq$  *nusmin*.

On entry, the line list for the separate connected component of the boundary is badly set: **lcomp**[ $l - 1$ ] =  $\langle value \rangle$  and  $l = \langle value \rangle$ . It should be less than or equal to **nlines** and greater than or equal to 1.

On entry, the number of points on line  $\langle value \rangle$  is  $\langle value \rangle$ . It should be greater than or equal to 2.

On entry, there is a correlation problem between the user-supplied coordinates and the specification of the polygonal arc representing line  $I = \langle value \rangle$  with the index in **crus** =  $\langle value \rangle$ .

On entry, the sum of absolute values of all numbers of line segments is different from **nlines**. The sum of all the elements of **nlcomp** =  $\langle value \rangle$ . **nlines** =  $\langle value \rangle$ .

### NE\_INT\_3

On entry, the absolute number of line segments in the  $k$ th component of the contour should be less than or equal to **nlines** and greater than 0.  $k = \langle value \rangle$ , **nlcomp**[ $k - 1$ ] =  $\langle value \rangle$  and **nlines** =  $\langle value \rangle$ .

On entry, the index of the first end point of line  $\langle value \rangle$  is  $\langle value \rangle$ . It should be greater than or equal to 1 and less than or equal to **nlines** =  $\langle value \rangle$ .

On entry, the index of the second end point of line  $\langle value \rangle$  is  $\langle value \rangle$ . It should be greater than or equal to 1 and less than or equal to **nlines** =  $\langle value \rangle$ .

On entry, the indices of the extremities of line  $\langle value \rangle$  are both equal to  $\langle value \rangle$ .

### NE\_INTERNAL\_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.

See Section 2.7.6 in How to Use the NAG Library and its Documentation for further information.

### NE\_MESH\_ERROR

An error has occurred during the generation of the boundary mesh. It appears that **nedmx** is not large enough: **nedmx** =  $\langle value \rangle$ .

An error has occurred during the generation of the boundary mesh. It appears that **nvmax** is not large enough: **nvmax** =  $\langle value \rangle$ .

On entry, end point 1, with index  $K$ , does not lie on the curve representing line  $I$  with index  $J$ :  $K = \langle value \rangle$ ,  $I = \langle value \rangle$ ,  $J = \langle value \rangle$ ,  $f(x, y) = \langle value \rangle$ .

On entry, end point 2, with index  $K$ , does not lie on the curve representing line  $I$  with index  $J$ :  $K = \langle value \rangle$ ,  $I = \langle value \rangle$ ,  $J = \langle value \rangle$ ,  $f(x, y) = \langle value \rangle$ .

On entry, the geometric progression ratio between the points to be generated on line  $\langle value \rangle$  is  $\langle value \rangle$ . It should be greater than 0 unless the line segment is defined by user-supplied points.

On entry, there is a problem with either the coordinates of characteristic points, or with the definition of the mesh lines.

#### NE\_NO\_LICENCE

Your licence key may have expired or may not have been installed correctly.

See Section 2.7.5 in How to Use the NAG Library and its Documentation for further information.

#### NE\_NOT\_CLOSE\_FILE

Cannot close file  $\langle value \rangle$ .

#### NE\_NOT\_WRITE\_FILE

Cannot open file  $\langle value \rangle$  for writing.

## 7 Accuracy

Not applicable.

## 8 Parallelism and Performance

nag\_mesh2d\_bound (d06bac) is not threaded in any implementation.

## 9 Further Comments

The boundary mesh generation technique in this function has a ‘tree’ structure. The boundary should be partitioned into geometrically simple segments (straight lines or curves) delimited by characteristic points. Then, the lines should be assembled into connected components of the boundary domain.

Using this strategy, the inputs to that function can be built up, following the requirements stated in Section 5:

the characteristic and the user-supplied intermediate points:

**nlines, sdcrus, coorch** and **crus**;

the characteristic lines:

**lined, fbnd, rate**;

finally the assembly of lines into the connected components of the boundary:

**ncomp**, and

**nlcomp, lcomp**.

The example below details the use of this strategy.

## 10 Example

The NAG logo is taken as an example of a geometry with holes. The boundary has been partitioned in 40 lines characteristic points; including 4 for the exterior boundary and 36 for the logo itself. All line geometry specifications have been considered, see the description of **lined**, including 4 lines defined as polygonal arc, 4 defined by **fbnd** and all the others are straight lines.

### 10.3 Program Results

nag\_mesh2d\_bound (d06bac) Example Program Results

Analysis of the boundary created:

The boundary mesh contains 259 vertices and 259 edges

There are 4 components comprising the boundary:

The 1-st component contains 4 lines in anticlockwise orientation

The 2-nd component contains 10 lines in clockwise orientation

The 3-rd component contains 8 lines in clockwise orientation

The 4-th component contains 18 lines in clockwise orientation

Boundary mesh characteristics

nvb = 259

nedge = 259

Complete mesh characteristics (Delaunay-Voronoi)

nv (rounded to nearest 10) = 650

nelt (rounded to nearest 10) = 1050

Complete mesh characteristics (Advancing Front)

nv (rounded to nearest 10) = 660

nelt (rounded to nearest 10) = 1060

**Example Program**  
Boundary Mesh of the NAG Logo with 259 Nodes and 259 Edges

Final Mesh Built Using the Delaunay-Voronoi Method

Final Mesh Built Using the Advancing Front Method
