

## NAG Library Function Document

### nag\_eigen\_real\_gen\_quad (f02jcc)

## 1 Purpose

nag\_eigen\_real\_gen\_quad (f02jcc) solves the quadratic eigenvalue problem

$$(\lambda^2 A + \lambda B + C)x = 0,$$

where  $A$ ,  $B$  and  $C$  are real  $n$  by  $n$  matrices.

The function returns the  $2n$  eigenvalues,  $\lambda_j$ , for  $j = 1, 2, \dots, 2n$ , and can optionally return the corresponding right eigenvectors,  $x_j$  and/or left eigenvectors,  $y_j$  as well as estimates of the condition numbers of the computed eigenvalues and backward errors of the computed right and left eigenvectors. A left eigenvector satisfies the equation

$$y^H (\lambda^2 A + \lambda B + C) = 0,$$

where  $y^H$  is the complex conjugate transpose of  $y$ .

$\lambda$  is represented as the pair  $(\alpha, \beta)$ , such that  $\lambda = \alpha/\beta$ . Note that the computation of  $\alpha/\beta$  may overflow and indeed  $\beta$  may be zero.

## 2 Specification

```
#include <nag.h>
#include <nagf02.h>

void nag_eigen_real_gen_quad (Nag_ScaleType scal, Nag_LeftVecsType jobvl,
    Nag_RightVecsType jobvr, Nag_CondErrType sense, double tol, Integer n,
    double a[], Integer pda, double b[], Integer pdb, double c[],
    Integer pdc, double alphar[], double alphai[], double beta[],
    double vl[], Integer pdvl, double vr[], Integer pdvr, double s[],
    double bevl[], double bevr[], Integer *iwarn, NagError *fail)
```

## 3 Description

The quadratic eigenvalue problem is solved by linearizing the problem and solving the resulting  $2n$  by  $2n$  generalized eigenvalue problem. The linearization is chosen to have favourable conditioning and backward stability properties. An initial preprocessing step is performed that reveals and deflates the zero and infinite eigenvalues contributed by singular leading and trailing matrices.

The algorithm is backward stable for problems that are not too heavily damped, that is  $\|B\| \leq 10\sqrt{\|A\| \cdot \|C\|}$ .

Further details on the algorithm are given in Hammarling *et al.* (2013).

## 5 Arguments

- 1: **scal** – Nag\_ScaleType *Input*  
*On entry:* determines the form of scaling to be performed on  $A$ ,  $B$  and  $C$ .  
**scal = Nag\_NoScale**  
 No scaling.  
**scal = Nag\_CondFanLinVanDooren** (the recommended value)  
 Fan, Lin and Van Dooren scaling if  $\frac{\|B\|}{\sqrt{\|A\| \times \|C\|}} < 10$  and no scaling otherwise where  $\|Z\|$  is the Frobenius norm of  $Z$ .  
**scal = Nag\_FanLinVanDooren**  
 Fan, Lin and Van Dooren scaling.  
**scal = Nag\_TropicalLargest**  
 Tropical scaling with largest root.  
**scal = Nag\_TropicalSmallest**  
 Tropical scaling with smallest root.  
*Constraint:* **scal** = Nag\_NoScale, Nag\_CondFanLinVanDooren, Nag\_FanLinVanDooren, Nag\_TropicalLargest or Nag\_TropicalSmallest.
- 2: **jobvl** – Nag\_LeftVecsType *Input*  
*On entry:* if **jobvl** = Nag\_NotLeftVecs, do not compute left eigenvectors.  
 If **jobvl** = Nag\_LeftVecs, compute the left eigenvectors.  
 If **sense** = Nag\_CondOnly, Nag\_BackErrLeft, Nag\_BackErrBoth, Nag\_CondBackErrLeft, Nag\_CondBackErrRight or Nag\_CondBackErrBoth, **jobvl** must be set to Nag\_LeftVecs.  
*Constraint:* **jobvl** = Nag\_NotLeftVecs or Nag\_LeftVecs.
- 3: **jobvr** – Nag\_RightVecsType *Input*  
*On entry:* if **jobvr** = Nag\_NotRightVecs, do not compute right eigenvectors.  
 If **jobvr** = Nag\_RightVecs, compute the right eigenvectors.  
 If **sense** = Nag\_CondOnly, Nag\_BackErrRight, Nag\_BackErrBoth, Nag\_CondBackErrLeft, Nag\_CondBackErrRight or Nag\_CondBackErrBoth, **jobvr** must be set to Nag\_RightVecs.  
*Constraint:* **jobvr** = Nag\_NotRightVecs or Nag\_RightVecs.
- 4: **sense** – Nag\_CondErrType *Input*  
*On entry:* determines whether, or not, condition numbers and backward errors are computed.  
**sense = Nag\_NoCondBackErr**  
 Do not compute condition numbers, or backward errors.  
**sense = Nag\_CondOnly**  
 Just compute condition numbers for the eigenvalues.  
**sense = Nag\_BackErrLeft**  
 Just compute backward errors for the left eigenpairs.  
**sense = Nag\_BackErrRight**  
 Just compute backward errors for the right eigenpairs.  
**sense = Nag\_BackErrBoth**  
 Compute backward errors for the left and right eigenpairs.  
**sense = Nag\_CondBackErrLeft**  
 Compute condition numbers for the eigenvalues and backward errors for the left eigenpairs.

**sense** = Nag\_CondBackErrRight  
 Compute condition numbers for the eigenvalues and backward errors for the right eigenpairs.

**sense** = Nag\_CondBackErrBoth  
 Compute condition numbers for the eigenvalues and backward errors for the left and right eigenpairs.

*Constraint:* **sense** = Nag\_NoCondBackErr, Nag\_CondOnly, Nag\_BackErrLeft, Nag\_BackErrRight, Nag\_BackErrBoth, Nag\_CondBackErrLeft, Nag\_CondBackErrRight or Nag\_CondBackErrBoth.

5: **tol** – double *Input*

*On entry:* **tol** is used as the tolerance for making decisions on rank in the deflation procedure. If **tol** is zero on entry then  $n \times \text{machine precision}$  is used in place of **tol**, where **machine precision** is as returned by function nag\_machine\_precision (X02AJC). A diagonal element of a triangular matrix,  $R$ , is regarded as zero if  $|r_{jj}| \leq \text{tol} \times \text{size}(X)$ , or  $n \times \text{machine precision} \times \text{size}(X)$  when **tol** is zero, where **size**( $X$ ) is based on the size of the absolute values of the elements of the matrix  $X$  containing the matrix  $R$ . See Hammarling *et al.* (2013) for the motivation. If **tol** is  $-1.0$  on entry then no deflation is attempted. The recommended value for **tol** is zero.

6: **n** – Integer *Input*

*On entry:* the order of the matrices  $A$ ,  $B$  and  $C$ .

*Constraint:* **n**  $\geq 0$ .

7: **a[dim]** – double *Input/Output*

**Note:** the dimension, **dim**, of the array **a** must be at least **pda**  $\times$  **n**.

The  $(i, j)$ th element of the matrix  $A$  is stored in **a**[( $j - 1$ )  $\times$  **pda** +  $i - 1$ ].

*On entry:* the  $n$  by  $n$  matrix  $A$ .

*On exit:* **a** is used as internal workspace, but if **jobvl** = Nag\_LeftVecs or **jobvr** = Nag\_RightVecs, then **a** is restored on exit.

8: **pda** – Integer *Input*

*On entry:* the stride separating matrix row elements in the array **a**.

*Constraint:* **pda**  $\geq n$ .

9: **b[dim]** – double *Input/Output*

**Note:** the dimension, **dim**, of the array **b** must be at least **pdb**  $\times$  **n**.

The  $(i, j)$ th element of the matrix  $B$  is stored in **b**[( $j - 1$ )  $\times$  **pdb** +  $i - 1$ ].

*On entry:* the  $n$  by  $n$  matrix  $B$ .

*On exit:* **b** is used as internal workspace, but is restored on exit.

10: **pdb** – Integer *Input*

*On entry:* the stride separating matrix row elements in the array **b**.

*Constraint:* **pdb**  $\geq n$ .

11: **c[dim]** – double *Input/Output*

**Note:** the dimension, **dim**, of the array **c** must be at least **pdc**  $\times$  **n**.

The  $(i, j)$ th element of the matrix  $C$  is stored in **c**[( $j - 1$ )  $\times$  **pdc** +  $i - 1$ ].

*On entry:* the  $n$  by  $n$  matrix  $C$ .

*On exit:* **c** is used as internal workspace, but if **jobvl** = Nag\_LeftVecs or **jobvr** = Nag\_RightVecs, **c** is restored on exit.

- 12: **pdc** – Integer *Input*  
*On entry:* the stride separating matrix row elements in the array **c**.  
*Constraint:* **pdc**  $\geq \mathbf{n}$ .
- 13: **alphar[2 × n]** – double *Output*  
*On exit:* **alphar**[ $j - 1$ ], for  $j = 1, 2, \dots, 2n$ , contains the real part of  $\alpha_j$  for the  $j$ th eigenvalue pair  $(\alpha_j, \beta_j)$  of the quadratic eigenvalue problem.
- 14: **alphai[2 × n]** – double *Output*  
*On exit:* **alphai**[ $j - 1$ ], for  $j = 1, 2, \dots, 2n$ , contains the imaginary part of  $\alpha_j$  for the  $j$ th eigenvalue pair  $(\alpha_j, \beta_j)$  of the quadratic eigenvalue problem. If **alphai**[ $j - 1$ ] is zero then the  $j$ th eigenvalue is real; if **alphai**[ $j - 1$ ] is positive then the  $j$ th and  $(j + 1)$ th eigenvalues are a complex conjugate pair, with **alphai**[ $j$ ] negative.
- 15: **beta[2 × n]** – double *Output*  
*On exit:* **beta**[ $j - 1$ ], for  $j = 1, 2, \dots, 2n$ , contains the second part of the  $j$ th eigenvalue pair  $(\alpha_j, \beta_j)$  of the quadratic eigenvalue problem, with  $\beta_j \geq 0$ . Infinite eigenvalues have  $\beta_j$  set to zero.
- 16: **vl[dim]** – double *Output*  
**Note:** the dimension, *dim*, of the array **vl** must be at least  $2 \times \mathbf{n}$  when **jobvl** = Nag\_LeftVecs. Where **VL**( $i, j$ ) appears in this document, it refers to the array element **vl**[ $(j - 1) \times \mathbf{pdvl} + i - 1$ ].  
*On exit:* if **jobvl** = Nag\_LeftVecs, the left eigenvectors  $y_j$  are stored one after another in **vl**, in the same order as the corresponding eigenvalues. If the  $j$ th eigenvalue is real, then  $y_j = \mathbf{VL}(:, j)$ , the  $j$ th column of **VL**. If the  $j$ th and  $(j + 1)$ th eigenvalues form a complex conjugate pair, then  $y_j = \mathbf{VL}(:, j) + i \times \mathbf{VL}(:, j + 1)$  and  $y_{j+1} = \mathbf{VL}(:, j) - i \times \mathbf{VL}(:, j + 1)$ . Each eigenvector will be normalized with length unity and with the element of largest modulus real and positive.  
If **jobvl** = Nag\_NotLeftVecs, **vl** is not referenced and may be **NULL**.
- 17: **pdvl** – Integer *Input*  
*On entry:* the stride separating matrix row elements in the array **vl**.  
*Constraint:* **pdvl**  $\geq \mathbf{n}$ .
- 18: **vr[dim]** – double *Output*  
**Note:** the dimension, *dim*, of the array **vr** must be at least  $2 \times \mathbf{n}$  when **jobvr** = Nag\_RightVecs. Where **VR**( $i, j$ ) appears in this document, it refers to the array element **vr**[ $(j - 1) \times \mathbf{pdvr} + i - 1$ ].  
*On exit:* if **jobvr** = Nag\_RightVecs, the right eigenvectors  $x_j$  are stored one after another in **vr**, in the same order as the corresponding eigenvalues. If the  $j$ th eigenvalue is real, then  $x_j = \mathbf{VR}(:, j)$ , the  $j$ th column of **VR**. If the  $j$ th and  $(j + 1)$ th eigenvalues form a complex conjugate pair, then  $x_j = \mathbf{VR}(:, j) + i \times \mathbf{VR}(:, j + 1)$  and  $x_{j+1} = \mathbf{VR}(:, j) - i \times \mathbf{VR}(:, j + 1)$ . Each eigenvector will be normalized with length unity and with the element of largest modulus real and positive.  
If **jobvr** = Nag\_NotRightVecs, **vr** is not referenced and may be **NULL**.

19:	<b>pdvr</b> – Integer	<i>Input</i>
<i>On entry:</i> the stride separating matrix row elements in the array <b>vr</b> .		
<i>Constraint:</i> <b>pdvr</b> $\geq \mathbf{n}$ .		
20:	<b>s[dim]</b> – double	<i>Output</i>
<b>Note:</b> the dimension, <i>dim</i> , of the array <b>s</b> must be at least $2 \times \mathbf{n}$ when <b>sense</b> = Nag_CondOnly, Nag_CondBackErrLeft, Nag_CondBackErrRight or Nag_CondBackErrBoth.		
<b>Note:</b> also: computing the condition numbers of the eigenvalues requires that both the left and right eigenvectors be computed.		
<i>On exit:</i> if <b>sense</b> = Nag_CondOnly, Nag_CondBackErrLeft, Nag_CondBackErrRight or Nag_CondBackErrBoth, <b>s</b> [ <i>j</i> – 1] contains the condition number estimate for the <i>j</i> th eigenvalue (large condition numbers imply that the problem is near one with multiple eigenvalues). Infinite condition numbers are returned as the largest model double number (nag_real_largest_number (X02ALC)).		
If <b>sense</b> = Nag_NoCondBackErr, Nag_BackErrLeft, Nag_BackErrRight or Nag_BackErrBoth, <b>s</b> is not referenced and may be <b>NULL</b> .		
21:	<b>bevl[dim]</b> – double	<i>Output</i>
<b>Note:</b> the dimension, <i>dim</i> , of the array <b>bevl</b> must be at least $2 \times \mathbf{n}$ when <b>sense</b> = Nag_BackErrLeft, Nag_BackErrBoth, Nag_CondBackErrLeft or Nag_CondBackErrBoth.		
<i>On exit:</i> if <b>sense</b> = Nag_BackErrLeft, Nag_BackErrBoth, Nag_CondBackErrLeft or Nag_CondBackErrBoth, <b>bevl</b> [ <i>j</i> – 1] contains the backward error estimate for the computed left eigenpair ( $\lambda_j, y_j$ ).		
If <b>sense</b> = Nag_NoCondBackErr, Nag_CondOnly, Nag_BackErrRight or Nag_CondBackErrRight, <b>bevl</b> is not referenced and may be <b>NULL</b> .		
22:	<b>bevr[dim]</b> – double	<i>Output</i>
<b>Note:</b> the dimension, <i>dim</i> , of the array <b>bevr</b> must be at least $2 \times \mathbf{n}$ when <b>sense</b> = Nag_BackErrRight, Nag_BackErrBoth, Nag_CondBackErrRight or Nag_CondBackErrBoth.		
<i>On exit:</i> if <b>sense</b> = Nag_BackErrRight, Nag_BackErrBoth, Nag_CondBackErrRight or Nag_CondBackErrBoth, <b>bevr</b> [ <i>j</i> – 1] contains the backward error estimate for the computed right eigenpair ( $\lambda_j, x_j$ ).		
If <b>sense</b> = Nag_NoCondBackErr, Nag_CondOnly, Nag_BackErrLeft or Nag_CondBackErrLeft, <b>bevr</b> is not referenced and may be <b>NULL</b> .		
23:	<b>iwarn</b> – Integer *	<i>Output</i>
<i>On exit:</i> <b>iwarn</b> will be positive if there are warnings, otherwise <b>iwarn</b> will be 0.		
If <b>fail.code</b> = NE_NOERROR then:		
if <b>iwarn</b> = 1 then one, or both, of the matrices <i>A</i> and <i>C</i> is zero. In this case no scaling is performed, even if <b>scal</b> > 0;		
if <b>iwarn</b> = 2 then the matrices <i>A</i> and <i>C</i> are singular, or nearly singular, so the problem is potentially ill-posed;		
if <b>iwarn</b> = 3 then both the conditions for <b>iwarn</b> = 1 and <b>iwarn</b> = 2 above, apply. If <b>iwarn</b> = 4, $\ \mathbf{b}\  \geq 10\sqrt{\ \mathbf{A}\  \cdot \ \mathbf{C}\ }$ and backward stability cannot be guaranteed.		
If <b>fail.code</b> = NE_ITERATIONS_QZ, nag_dgges (f08xac) has flagged that <b>iwarn</b> eigenvalues are invalid.		

If **fail.code** = NE\_ITERATIONS\_QZ, nag\_dggev (f08wac) has flagged that **iwarn** eigenvalues are invalid.

24: **fail** – NagError \* *Input/Output*

The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

## 6 Error Indicators and Warnings

### **NE\_ALLOC\_FAIL**

Dynamic memory allocation failed.

See Section 2.3.1.2 in How to Use the NAG Library and its Documentation for further information.

### **NE\_ARRAY\_SIZE**

On entry, **pda** =  $\langle value \rangle$  and **n** =  $\langle value \rangle$ .

Constraint: **pda**  $\geq$  **n**.

On entry, **pdb** =  $\langle value \rangle$  and **n** =  $\langle value \rangle$ .

Constraint: **pdb**  $\geq$  **n**.

On entry, **pdc** =  $\langle value \rangle$  and **n** =  $\langle value \rangle$ .

Constraint: **pdc**  $\geq$  **n**.

On entry, **pdvl** =  $\langle value \rangle$ , **n** =  $\langle value \rangle$  and **jobvl** =  $\langle value \rangle$ .

Constraint: when **jobvl** = Nag\_LeftVecs, **pdvl**  $\geq$  **n**.

On entry, **pdvr** =  $\langle value \rangle$ , **n** =  $\langle value \rangle$  and **jobvr** =  $\langle value \rangle$ .

Constraint: when **jobvr** = Nag\_RightVecs, **pdvr**  $\geq$  **n**.

### **NE\_BAD\_PARAM**

On entry, argument  $\langle value \rangle$  had an illegal value.

### **NE\_INT**

On entry, **n** =  $\langle value \rangle$ .

Constraint: **n**  $\geq$  0.

### **NE\_INTERNAL\_ERROR**

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.

See Section 2.7.6 in How to Use the NAG Library and its Documentation for further information.

### **NE\_INVALID\_VALUE**

On entry, **sense** =  $\langle value \rangle$  and **jobvl** =  $\langle value \rangle$ .

Constraint: when **jobvl** = Nag\_NotLeftVecs, **sense** = Nag\_NoCondBackErr or Nag\_BackErrRight, when **jobvl** = Nag\_LeftVecs, **sense** = Nag\_CondOnly, Nag\_BackErrLeft, Nag\_BackErrBoth, Nag\_CondBackErrLeft, Nag\_CondBackErrRight or Nag\_CondBackErrBoth.

On entry, **sense** =  $\langle value \rangle$  and **jobvr** =  $\langle value \rangle$ .

Constraint: when **jobvr** = Nag\_NotRightVecs, **sense** = Nag\_NoCondBackErr or Nag\_BackErrLeft,

when **jobvr** = Nag\_RightVecs, **sense** = Nag\_CondOnly, Nag\_BackErrRight, Nag\_BackErrBoth, Nag\_CondBackErrLeft, Nag\_CondBackErrRight or Nag\_CondBackErrBoth.

**NE\_ITERATIONS\_QZ**

The *QZ* iteration failed in nag\_dggev (f08wac).

**iwarn** returns the value of **info** returned by nag\_dggev (f08wac). This failure is unlikely to happen, but if it does, please contact NAG.

The *QZ* iteration failed in nag\_dgges (f08xac).

**iwarn** returns the value of **info** returned by nag\_dgges (f08xac). This failure is unlikely to happen, but if it does, please contact NAG.

**NE\_NO\_LICENCE**

Your licence key may have expired or may not have been installed correctly.

See Section 2.7.5 in How to Use the NAG Library and its Documentation for further information.

**NE\_SINGULAR**

The quadratic matrix polynomial is nonregular (singular).

## 7 Accuracy

The algorithm is backward stable for problems that are not too heavily damped, that is  $\|B\| \leq 10\sqrt{\|A\| \cdot \|C\|}$ .

## 8 Parallelism and Performance

nag\_eigen\_real\_gen\_quad (f02jcc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

nag\_eigen\_real\_gen\_quad (f02jcc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the x06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

## 9 Further Comments

None.

## 10 Example

To solve the quadratic eigenvalue problem

$$(\lambda^2 A + \lambda B + C)x = 0$$

where

$$A = \begin{pmatrix} 1 & 2 & 2 \\ 3 & 1 & 1 \\ 3 & 2 & 1 \end{pmatrix}, \quad B = \begin{pmatrix} 3 & 2 & 1 \\ 2 & 1 & 3 \\ 1 & 3 & 2 \end{pmatrix} \quad \text{and} \quad C = \begin{pmatrix} 1 & 1 & 2 \\ 2 & 3 & 1 \\ 3 & 1 & 2 \end{pmatrix}.$$

The example also returns the left eigenvectors, condition numbers for the computed eigenvalues and backward errors of the computed right and left eigenpairs.
