

# NAG Library Function Document

## nag\_dspsvx (f07pbc)

### 1 Purpose

nag\_dspsvx (f07pbc) uses the diagonal pivoting factorization

$$A = UDU^T \quad \text{or} \quad A = LDL^T$$

to compute the solution to a real system of linear equations

$$AX = B,$$

where  $A$  is an  $n$  by  $n$  symmetric matrix stored in packed format and  $X$  and  $B$  are  $n$  by  $r$  matrices. Error bounds on the solution and a condition estimate are also provided.

### 2 Specification

```
#include <nag.h>
#include <nagf07.h>

void nag_dspsvx (Nag_OrderType order, Nag_FactoredFormType fact,
                Nag_UploType uplo, Integer n, Integer nrhs, const double ap[],
                double afp[], Integer ipiv[], const double b[], Integer pdb, double x[],
                Integer pdx, double *rcond, double ferr[], double berr[],
                NagError *fail)
```

### 3 Description

nag\_dspsvx (f07pbc) performs the following steps:

1. If **fact** = Nag\_NotFactored, the diagonal pivoting method is used to factor  $A$  as  $A = UDU^T$  if **uplo** = Nag\_Upper or  $A = LDL^T$  if **uplo** = Nag\_Lower, where  $U$  (or  $L$ ) is a product of permutation and unit upper (lower) triangular matrices and  $D$  is symmetric and block diagonal with 1 by 1 and 2 by 2 diagonal blocks.
2. If some  $d_{ii} = 0$ , so that  $D$  is exactly singular, then the function returns with **fail.errnum** =  $i$  and **fail.code** = NE\_SINGULAR. Otherwise, the factored form of  $A$  is used to estimate the condition number of the matrix  $A$ . If the reciprocal of the condition number is less than **machine precision**, **fail.code** = NE\_SINGULAR\_WP is returned as a warning, but the function still goes on to solve for  $X$  and compute error bounds as described below.
3. The system of equations is solved for  $X$  using the factored form of  $A$ .
4. Iterative refinement is applied to improve the computed solution matrix and to calculate error bounds and backward error estimates for it.

## 5 Arguments

- 1: **order** – Nag\_OrderType *Input*  
*On entry:* the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag\_RowMajor. See Section 2.3.1.3 in How to Use the NAG Library and its Documentation for a more detailed explanation of the use of this argument.  
*Constraint:* **order** = Nag\_RowMajor or Nag\_ColMajor.
- 2: **fact** – Nag\_FactoredFormType *Input*  
*On entry:* specifies whether or not the factorized form of the matrix  $A$  has been supplied.  
**fact** = Nag\_Factored  
**afp** and **ipiv** contain the factorized form of the matrix  $A$ . **afp** and **ipiv** will not be modified.  
**fact** = Nag\_NotFactored  
The matrix  $A$  will be copied to **afp** and factorized.  
*Constraint:* **fact** = Nag\_Factored or Nag\_NotFactored.
- 3: **uplo** – Nag\_UploType *Input*  
*On entry:* if **uplo** = Nag\_Upper, the upper triangle of  $A$  is stored.  
If **uplo** = Nag\_Lower, the lower triangle of  $A$  is stored.  
*Constraint:* **uplo** = Nag\_Upper or Nag\_Lower.
- 4: **n** – Integer *Input*  
*On entry:*  $n$ , the number of linear equations, i.e., the order of the matrix  $A$ .  
*Constraint:*  $n \geq 0$ .
- 5: **nrhs** – Integer *Input*  
*On entry:*  $r$ , the number of right-hand sides, i.e., the number of columns of the matrix  $B$ .  
*Constraint:* **nrhs**  $\geq 0$ .
- 6: **ap**[*dim*] – const double *Input*  
**Note:** the dimension, *dim*, of the array **ap** must be at least  $\max(1, n \times (n + 1)/2)$ .  
*On entry:* the  $n$  by  $n$  symmetric matrix  $A$ , packed by rows or columns.  
The storage of elements  $A_{ij}$  depends on the **order** and **uplo** arguments as follows:  
if **order** = Nag\_ColMajor and **uplo** = Nag\_Upper,  
 $A_{ij}$  is stored in **ap**[( $j - 1$ )  $\times$   $j/2 + i - 1$ ], for  $i \leq j$ ;  
if **order** = Nag\_ColMajor and **uplo** = Nag\_Lower,  
 $A_{ij}$  is stored in **ap**[( $2n - j$ )  $\times$  ( $j - 1$ )/2 +  $i - 1$ ], for  $i \geq j$ ;  
if **order** = Nag\_RowMajor and **uplo** = Nag\_Upper,  
 $A_{ij}$  is stored in **ap**[( $2n - i$ )  $\times$  ( $i - 1$ )/2 +  $j - 1$ ], for  $i \leq j$ ;  
if **order** = Nag\_RowMajor and **uplo** = Nag\_Lower,  
 $A_{ij}$  is stored in **ap**[( $i - 1$ )  $\times$   $i/2 + j - 1$ ], for  $i \geq j$ .
- 7: **afp**[*dim*] – double *Input/Output*  
**Note:** the dimension, *dim*, of the array **afp** must be at least  $\max(1, n \times (n + 1)/2)$ .

*On entry:* if **fact** = Nag\_Factored, **afp** contains the block diagonal matrix  $D$  and the multipliers used to obtain the factor  $U$  or  $L$  from the factorization  $A = UDU^T$  or  $A = LDL^T$  as computed by nag\_dsptf (f07pdc), stored as a packed triangular matrix in the same storage format as  $A$ .

*On exit:* if **fact** = Nag\_NotFactored, **afp** contains the block diagonal matrix  $D$  and the multipliers used to obtain the factor  $U$  or  $L$  from the factorization  $A = UDU^T$  or  $A = LDL^T$  as computed by nag\_dsptf (f07pdc), stored as a packed triangular matrix in the same storage format as  $A$ .

8: **ipiv**[*n*] – Integer *Input/Output*

*On entry:* if **fact** = Nag\_Factored, **ipiv** contains details of the interchanges and the block structure of  $D$ , as determined by nag\_dsptf (f07pdc).

if **ipiv**[ $i - 1$ ] =  $k > 0$ ,  $d_{ii}$  is a 1 by 1 pivot block and the  $i$ th row and column of  $A$  were interchanged with the  $k$ th row and column;

if **uplo** = Nag\_Upper and **ipiv**[ $i - 2$ ] = **ipiv**[ $i - 1$ ] =  $-l < 0$ ,  $\begin{pmatrix} d_{i-1,i-1} & \bar{d}_{i,i-1} \\ \bar{d}_{i,i-1} & d_{ii} \end{pmatrix}$  is a 2 by 2 pivot block and the  $(i - 1)$ th row and column of  $A$  were interchanged with the  $l$ th row and column;

if **uplo** = Nag\_Lower and **ipiv**[ $i - 1$ ] = **ipiv**[ $i$ ] =  $-m < 0$ ,  $\begin{pmatrix} d_{ii} & d_{i+1,i} \\ d_{i+1,i} & d_{i+1,i+1} \end{pmatrix}$  is a 2 by 2 pivot block and the  $(i + 1)$ th row and column of  $A$  were interchanged with the  $m$ th row and column.

*On exit:* if **fact** = Nag\_NotFactored, **ipiv** contains details of the interchanges and the block structure of  $D$ , as determined by nag\_dsptf (f07pdc), as described above.

9: **b**[*dim*] – const double *Input*

**Note:** the dimension, *dim*, of the array **b** must be at least

$\max(1, \mathbf{pdb} \times \mathbf{nrhs})$  when **order** = Nag\_ColMajor;

$\max(1, \mathbf{n} \times \mathbf{pdb})$  when **order** = Nag\_RowMajor.

The  $(i, j)$ th element of the matrix  $B$  is stored in

**b**[( $j - 1$ )  $\times$  **pdb** +  $i - 1$ ] when **order** = Nag\_ColMajor;

**b**[( $i - 1$ )  $\times$  **pdb** +  $j - 1$ ] when **order** = Nag\_RowMajor.

*On entry:* the  $n$  by  $r$  right-hand side matrix  $B$ .

10: **pdb** – Integer *Input*

*On entry:* the stride separating row or column elements (depending on the value of **order**) in the array **b**.

*Constraints:*

if **order** = Nag\_ColMajor, **pdb**  $\geq \max(1, \mathbf{n})$ ;

if **order** = Nag\_RowMajor, **pdb**  $\geq \max(1, \mathbf{nrhs})$ .

11: **x**[*dim*] – double *Output*

**Note:** the dimension, *dim*, of the array **x** must be at least

$\max(1, \mathbf{pdx} \times \mathbf{nrhs})$  when **order** = Nag\_ColMajor;

$\max(1, \mathbf{n} \times \mathbf{pdx})$  when **order** = Nag\_RowMajor.

The  $(i, j)$ th element of the matrix  $X$  is stored in

**x**[( $j - 1$ )  $\times$  **pdx** +  $i - 1$ ] when **order** = Nag\_ColMajor;

**x**[( $i - 1$ )  $\times$  **pdx** +  $j - 1$ ] when **order** = Nag\_RowMajor.

*On exit:* if **fail.code** = NE\_NOERROR or NE\_SINGULAR\_WP, the  $n$  by  $r$  solution matrix  $X$ .

- 12: **pdx** – Integer *Input*  
*On entry:* the stride separating row or column elements (depending on the value of **order**) in the array **x**.  
*Constraints:*  
 if **order** = Nag\_ColMajor, **pdx**  $\geq$  max(1, **n**);  
 if **order** = Nag\_RowMajor, **pdx**  $\geq$  max(1, **nrhs**).
- 13: **rcond** – double \* *Output*  
*On exit:* the estimate of the reciprocal condition number of the matrix *A*. If **rcond** = 0.0, the matrix may be exactly singular. This condition is indicated by **fail.code** = NE\_SINGULAR. Otherwise, if **rcond** is less than the *machine precision*, the matrix is singular to working precision. This condition is indicated by **fail.code** = NE\_SINGULAR\_WP.
- 14: **ferr**[**nrhs**] – double *Output*  
*On exit:* if **fail.code** = NE\_NOERROR or NE\_SINGULAR\_WP, an estimate of the forward error bound for each computed solution vector, such that  $\|\hat{x}_j - x_j\|_\infty / \|x_j\|_\infty \leq \mathbf{ferr}[j - 1]$  where  $\hat{x}_j$  is the *j*th column of the computed solution returned in the array **x** and  $x_j$  is the corresponding column of the exact solution *X*. The estimate is as reliable as the estimate for **rcond**, and is almost always a slight overestimate of the true error.
- 15: **berr**[**nrhs**] – double *Output*  
*On exit:* if **fail.code** = NE\_NOERROR or NE\_SINGULAR\_WP, an estimate of the component-wise relative backward error of each computed solution vector  $\hat{x}_j$  (i.e., the smallest relative change in any element of *A* or *B* that makes  $\hat{x}_j$  an exact solution).
- 16: **fail** – NagError \* *Input/Output*  
 The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).

## 6 Error Indicators and Warnings

### NE\_ALLOC\_FAIL

Dynamic memory allocation failed.

See Section 2.3.1.2 in How to Use the NAG Library and its Documentation for further information.

### NE\_BAD\_PARAM

On entry, argument *<value>* had an illegal value.

### NE\_INT

On entry, **n** = *<value>*.

Constraint: **n**  $\geq$  0.

On entry, **nrhs** = *<value>*.

Constraint: **nrhs**  $\geq$  0.

On entry, **pdb** = *<value>*.

Constraint: **pdb**  $>$  0.

On entry, **pdx** = *<value>*.

Constraint: **pdx**  $>$  0.

**NE\_INT\_2**

On entry, **pdb** =  $\langle value \rangle$  and **n** =  $\langle value \rangle$ .

Constraint: **pdb**  $\geq \max(1, \mathbf{n})$ .

On entry, **pdb** =  $\langle value \rangle$  and **nrhs** =  $\langle value \rangle$ .

Constraint: **pdb**  $\geq \max(1, \mathbf{nrhs})$ .

On entry, **pdx** =  $\langle value \rangle$  and **n** =  $\langle value \rangle$ .

Constraint: **pdx**  $\geq \max(1, \mathbf{n})$ .

On entry, **pdx** =  $\langle value \rangle$  and **nrhs** =  $\langle value \rangle$ .

Constraint: **pdx**  $\geq \max(1, \mathbf{nrhs})$ .

**NE\_INTERNAL\_ERROR**

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.

See Section 2.7.6 in How to Use the NAG Library and its Documentation for further information.

**NE\_NO\_LICENCE**

Your licence key may have expired or may not have been installed correctly.

See Section 2.7.5 in How to Use the NAG Library and its Documentation for further information.

**NE\_SINGULAR**

Element  $\langle value \rangle$  of the diagonal is exactly zero. The factorization has been completed, but the factor  $D$  is exactly singular, so the solution and error bounds could not be computed. **rcond** = 0.0 is returned.

**NE\_SINGULAR\_WP**

$D$  is nonsingular, but **rcond** is less than *machine precision*, meaning that the matrix is singular to working precision. Nevertheless, the solution and error bounds are computed because there are a number of situations where the computed solution can be more accurate than the value of **rcond** would suggest.

**7 Accuracy**

For each right-hand side vector  $b$ , the computed solution  $\hat{x}$  is the exact solution of a perturbed system of equations  $(A + E)\hat{x} = b$ , where

$$\|E\|_1 = O(\epsilon)\|A\|_1,$$

where  $\epsilon$  is the *machine precision*. See Chapter 11 of Higham (2002) for further details.

If  $\hat{x}$  is the true solution, then the computed solution  $x$  satisfies a forward error bound of the form

$$\frac{\|x - \hat{x}\|_\infty}{\|\hat{x}\|_\infty} \leq w_c \text{cond}(A, \hat{x}, b)$$

where  $\text{cond}(A, \hat{x}, b) = \frac{\| |A^{-1}|(|A|\|\hat{x}\| + |b|) \|_\infty}{\|\hat{x}\|_\infty} \leq \text{cond}(A) = \| |A^{-1}| |A| \|_\infty \leq \kappa_\infty(A)$ . If  $\hat{x}$  is the  $j$ th column of  $X$ , then  $w_c$  is returned in **berr**[ $j - 1$ ] and a bound on  $\|x - \hat{x}\|_\infty / \|\hat{x}\|_\infty$  is returned in **ferr**[ $j - 1$ ]. See Section 4.4 of Anderson *et al.* (1999) for further details.

**8 Parallelism and Performance**

nag\_dspsvx (f07pbc) is threaded by NAG for parallel execution in multithreaded implementations of the NAG Library.

nag\_dspsvx (f07pbc) makes calls to BLAS and/or LAPACK routines, which may be threaded within the vendor library used by this implementation. Consult the documentation for the vendor library for further information.

Please consult the x06 Chapter Introduction for information on how to control and interrogate the OpenMP environment used within this function. Please also consult the Users' Note for your implementation for any additional implementation-specific information.

## 9 Further Comments

The factorization of  $A$  requires approximately  $\frac{1}{3}n^3$  floating-point operations.

For each right-hand side, computation of the backward error involves a minimum of  $4n^2$  floating-point operations. Each step of iterative refinement involves an additional  $6n^2$  operations. At most five steps of iterative refinement are performed, but usually only one or two steps are required. Estimating the forward error involves solving a number of systems of equations of the form  $Ax = b$ ; the number is usually 4 or 5 and never more than 11. Each solution involves approximately  $2n^2$  operations.

The complex analogues of this function are nag\_zhpsvx (f07ppc) for Hermitian matrices, and nag\_zspsvx (f07qpc) for symmetric matrices.

## 10 Example

This example solves the equations

$$AX = B,$$

where  $A$  is the symmetric matrix

$$A = \begin{pmatrix} -1.81 & 2.06 & 0.63 & -1.15 \\ 2.06 & 1.15 & 1.87 & 4.20 \\ 0.63 & 1.87 & -0.21 & 3.87 \\ -1.15 & 4.20 & 3.87 & 2.07 \end{pmatrix} \quad \text{and} \quad B = \begin{pmatrix} 0.96 & 3.93 \\ 6.07 & 19.25 \\ 8.38 & 9.90 \\ 9.50 & 27.85 \end{pmatrix}.$$

Error estimates for the solutions, and an estimate of the reciprocal of the condition number of the matrix  $A$  are also output.
