nag_prob_poisson_vector (g01skc)

1 Purpose

nag_prob_poisson_vector (g01skc) returns a number of the lower tail, upper tail and point probabilities for the Poisson distribution.

2 Specification

```
#include <nag.h>
#include <nagg01.h>
void nag_prob_poisson_vector (Integer ll, const double l[], Integer lk,
    const Integer k[], double plek[], double pgtk[], double peqk[],
    Integer ivalid[], NagError *fail)
```

3 Description

Let $X = \{X_i : i = 1, 2, \dots, m\}$ denote a vector of random variables each having a Poisson distribution with parameter λ_i (> 0). Then

$$\text{Prob}\{X_i = k_i\} = e^{-\lambda_i} \frac{\lambda_i^{k_i}}{k_i!}, \quad k_i = 0, 1, 2, \dots$$

The mean and variance of each distribution are both equal to λ_i .

nag_prob_poisson_vector (g01skc) computes, for given λ_i and k_i the probabilities: $\text{Prob}\{X_i \leq k_i\}$, $\text{Prob}\{X_i > k_i\}$ and $\text{Prob}\{X_i = k_i\}$ using the algorithm described in Knīsel (1986).

The input arrays to this function are designed to allow maximum flexibility in the supply of vector arguments by re-using elements of any arrays that are shorter than the total number of evaluations required. See Section 2.6 in the g01 Chapter Introduction for further information.

5 Arguments

- | | | |
|----|--|--------------|
| 1: | ll – Integer | <i>Input</i> |
| | <i>On entry</i> : the length of the array l . | |
| | <i>Constraint</i> : ll > 0. | |
| 2: | I[ll] – const double | <i>Input</i> |
| | <i>On entry</i> : λ_i , the parameter of the Poisson distribution with $\lambda_i = \mathbf{l}[j]$, $j = (i - 1) \bmod \mathbf{ll}$, for $i = 1, 2, \dots, \max(\mathbf{ll}, \mathbf{lk})$. | |
| | <i>Constraint</i> : $0.0 < \mathbf{l}[j - 1] \leq 10^6$, for $j = 1, 2, \dots, \mathbf{ll}$. | |
| 3: | lk – Integer | <i>Input</i> |
| | <i>On entry</i> : the length of the array k . | |
| | <i>Constraint</i> : lk > 0. | |

4:	k[lk] – const Integer	<i>Input</i>
<i>On entry:</i> k_i , the integer which defines the required probabilities with $k_i = \mathbf{k}[j]$, $j = (i - 1) \bmod \mathbf{lk}$.		
<i>Constraint:</i> $\mathbf{k}[j - 1] \geq 0$, for $j = 1, 2, \dots, \mathbf{lk}$.		
5:	plek[dim] – double	<i>Output</i>
Note: the dimension, dim , of the array plek must be at least $\max(\mathbf{ll}, \mathbf{lk})$.		
<i>On exit:</i> $\text{Prob}\{X_i \leq k_i\}$, the lower tail probabilities.		
6:	pgtk[dim] – double	<i>Output</i>
Note: the dimension, dim , of the array pgtk must be at least $\max(\mathbf{ll}, \mathbf{lk})$.		
<i>On exit:</i> $\text{Prob}\{X_i > k_i\}$, the upper tail probabilities.		
7:	peqk[dim] – double	<i>Output</i>
Note: the dimension, dim , of the array peqk must be at least $\max(\mathbf{ll}, \mathbf{lk})$.		
<i>On exit:</i> $\text{Prob}\{X_i = k_i\}$, the point probabilities.		
8:	invalid[dim] – Integer	<i>Output</i>
Note: the dimension, dim , of the array invalid must be at least $\max(\mathbf{ll}, \mathbf{lk})$.		
<i>On exit:</i> invalid [$i - 1$] indicates any errors with the input arguments, with		
invalid [$i - 1$] = 0 No error.		
invalid [$i - 1$] = 1 On entry, $\lambda_i \leq 0.0$.		
invalid [$i - 1$] = 2 On entry, $k_i < 0$.		
invalid [$i - 1$] = 3 On entry, $\lambda_i > 10^6$.		
9:	fail – NagError *	<i>Input/Output</i>
The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).		

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.

See Section 2.3.1.2 in How to Use the NAG Library and its Documentation for further information.

NE_ARRAY_SIZE

On entry, array size = $\langle value \rangle$.
Constraint: $\mathbf{lk} > 0$.

On entry, array size = $\langle value \rangle$.
Constraint: $\mathbf{ll} > 0$.

NE_BAD_PARAM

On entry, argument $\langle value \rangle$ had an illegal value.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.

See Section 2.7.6 in How to Use the NAG Library and its Documentation for further information.

NE_NO_LICENCE

Your licence key may have expired or may not have been installed correctly.

See Section 2.7.5 in How to Use the NAG Library and its Documentation for further information.

NW_INVALID

On entry, at least one value of **I** or **k** was invalid.

Check **invalid** for more information.

7 Accuracy

Results are correct to a relative accuracy of at least 10^{-6} on machines with a precision of 9 or more decimal digits (provided that the results do not underflow to zero).

8 Parallelism and Performance

`nag_prob_poisson_vector` (g01skc) is not threaded in any implementation.

9 Further Comments

The time taken by `nag_prob_poisson_vector` (g01skc) to calculate each probability depends on λ_i and k_i . For given λ_i , the time is greatest when $k_i \approx \lambda_i$, and is then approximately proportional to $\sqrt{\lambda_i}$.

10 Example

This example reads a vector of values for λ and k , and prints the corresponding probabilities.
