

NAG Library Function Document

nag_kalman_sqrt_filt_cov_invar (g13ebc)

1 Purpose

nag_kalman_sqrt_filt_cov_invar (g13ebc) performs a combined measurement and time update of one iteration of the time-invariant Kalman filter. The method employed for this update is the square root covariance filter with the system matrices transformed into condensed observer Hessenberg form.

2 Specification

```
#include <nag.h>
#include <nagg13.h>

void nag_kalman_sqrt_filt_cov_invar (Integer n, Integer m, Integer p,
                                     double s[], Integer tds, const double a[], Integer tda,
                                     const double b[], Integer tdb, const double q[], Integer tdq,
                                     const double c[], Integer tdc, const double r[], Integer tdr,
                                     double k[], Integer tdk, double h[], Integer tdh, double tol,
                                     NagError *fail)
```

3 Description

For the state space system defined by

$$\begin{aligned} X_{i+1} &= AX_i + BW_i & \text{var}(W_i) = Q_i \\ Y_i &= CX_i + V_i & \text{var}(V_i) = R_i \end{aligned}$$

the estimate of X_i given observations Y_1 to Y_{i-1} is denoted by $\hat{X}_{i|i-1}$, with $\text{var}(\hat{X}_{i|i-1}) = P_{i|i-1} = S_i S_i^T$ (where A , B and C are time invariant). The function performs one recursion of the square root covariance filter algorithm, summarised as follows:

$$\begin{array}{ccc} \left(\begin{array}{ccc} R_i^{1/2} & 0 & CS_i \\ 0 & BQ_i^{1/2} & AS_i \end{array} \right) & U_1 = & \left(\begin{array}{ccc} H_i^{1/2} & 0 & 0 \\ G_i & S_{i+1} & 0 \end{array} \right) \\ \text{(Pre-array)} & & \text{(Post-array)} \end{array}$$

where U_1 is an orthogonal transformation triangularizing the pre-array, and the matrix pair (A, C) is in lower observer Hessenberg form. The triangularization is carried out via Householder transformations exploiting the zero pattern of the pre-array. An example of the pre-array is given below (where $n = 6, p = 2$ and $m = 3$):

$$\left(\begin{array}{cccc|cc|c|c|c|c} x & & & & x & & & & & & & \\ x & x & & & x & x & & & & & & \\ & x & x & x & x & x & x & & & & & \\ \hline x & x & x & x & x & x & x & x & & & & \\ x & x & x & x & x & x & x & x & x & & & \\ x & x & x & x & x & x & x & x & x & x & & \\ x & x & x & x & x & x & x & x & x & x & x & \\ x & x & x & x & x & x & x & x & x & x & x & \end{array} \right)$$

The measurement-update for the estimated state vector X is

$$\hat{X}_{i|i} = \hat{X}_{i|i-1} - K_i [C\hat{X}_{i|i-1} - Y_i]$$

whilst the time-update for X is

$$\hat{X}_{i+1|i} = A\hat{X}_{i|i} + D_i U_i$$

where $D_i U_i$ represents any deterministic control used. The relationship between the Kalman gain matrix K_i and G_i is

$$AK_i = G_i \left(H_i^{1/2} \right)$$

The function returns the product of the matrices A and K_i , represented as AK_i , and the state covariance matrix $P_{i|i-1}$ factorized as $P_{i|i-1} = S_i S_i^T$ (see the Introduction to Chapter g13 for more information concerning the covariance filter).

5 Arguments

- 1: **n** – Integer *Input*
On entry: the actual state dimension, n , i.e., the order of the matrices S_i and A .
Constraint: $\mathbf{n} \geq 1$.
- 2: **m** – Integer *Input*
On entry: the actual input dimension, m , i.e., the order of the matrix $Q_i^{1/2}$.
Constraint: $\mathbf{m} \geq 1$.
- 3: **p** – Integer *Input*
On entry: the actual output dimension, p , i.e., the order of the matrix $R_i^{1/2}$.
Constraint: $\mathbf{p} \geq 1$.
- 4: **s[n × tds]** – double *Input/Output*
Note: the (i, j) th element of the matrix S is stored in $\mathbf{s}[(i - 1) \times \mathbf{tds} + j - 1]$.
On entry: the leading n by n lower triangular part of this array must contain S_i , the left Cholesky factor of the state covariance matrix $P_{i|i-1}$.
On exit: the leading n by n lower triangular part of this array contains S_{i+1} , the left Cholesky factor of the state covariance matrix $P_{i+1|i}$.
- 5: **tds** – Integer *Input*
On entry: the stride separating matrix column elements in the array \mathbf{s} .
Constraint: $\mathbf{tds} \geq \mathbf{n}$.

- 6: **a**[$\mathbf{n} \times \mathbf{tda}$] – const double *Input*
Note: the (i, j) th element of the matrix A is stored in $\mathbf{a}[(i - 1) \times \mathbf{tda} + j - 1]$.
On entry: the leading n by n part of this array must contain the lower observer Hessenberg matrix UAU^T . Where A is the state transition matrix of the discrete system and U is the unitary transformation generated by the function nag_trans_hessenberg_observer (g13ewc).
- 7: **tda** – Integer *Input*
On entry: the stride separating matrix column elements in the array **a**.
Constraint: $\mathbf{tda} \geq \mathbf{n}$.
- 8: **b**[$\mathbf{n} \times \mathbf{tdb}$] – const double *Input*
Note: the (i, j) th element of the matrix B is stored in $\mathbf{b}[(i - 1) \times \mathbf{tdb} + j - 1]$.
On entry: if **q** is not **NULL** then the leading n by m part of this array must contain the matrix UB , otherwise (if **q** is **NULL** then the leading n by m part of the array must contain the matrix $UBQ_i^{1/2}$. B is the input weight matrix, Q_i is the noise covariance matrix and U is the same unitary transformation used for defining array arguments **a** and **c**.
- 9: **tdb** – Integer *Input*
On entry: the stride separating matrix column elements in the array **b**.
Constraint: $\mathbf{tdb} \geq \mathbf{m}$.
- 10: **q**[$\mathbf{m} \times \mathbf{tdq}$] – const double *Input*
Note: the (i, j) th element of the matrix Q is stored in $\mathbf{q}[(i - 1) \times \mathbf{tdq} + j - 1]$.
On entry: if the noise covariance matrix is to be supplied separately from the input weight matrix then the leading m by m lower triangular part of this array must contain $Q_i^{1/2}$, the left Cholesky factor process noise covariance matrix. If the noise covariance matrix is to be input with the weight matrix as $BQ_i^{1/2}$ then the array **q** must be set to **NULL**.
- 11: **tdq** – Integer *Input*
On entry: the stride separating matrix column elements in the array **q**.
Constraint: $\mathbf{tdq} \geq \mathbf{m}$ if **q** is defined.
- 12: **c**[$\mathbf{p} \times \mathbf{tdc}$] – const double *Input*
Note: the (i, j) th element of the matrix C is stored in $\mathbf{c}[(i - 1) \times \mathbf{tdc} + j - 1]$.
On entry: the leading p by n part of this array must contain the lower observer Hessenberg matrix CUT^T . Where C is the output weight matrix of the discrete system and U is the unitary transformation matrix generated by the function nag_trans_hessenberg_observer (g13ewc).
- 13: **tdc** – Integer *Input*
On entry: the stride separating matrix column elements in the array **c**.
Constraint: $\mathbf{tdc} \geq \mathbf{n}$.
- 14: **r**[$\mathbf{p} \times \mathbf{tdr}$] – const double *Input*
Note: the (i, j) th element of the matrix R is stored in $\mathbf{r}[(i - 1) \times \mathbf{tdr} + j - 1]$.
On entry: the leading p by p lower triangular part of this array must contain $R_i^{1/2}$, the left Cholesky factor of the measurement noise covariance matrix.

15:	tdr – Integer	<i>Input</i>
<i>On entry:</i> the stride separating matrix column elements in the array r .		
<i>Constraint:</i> $\text{tdr} \geq p$.		
16:	k [n × tdk] – double	<i>Output</i>
Note: the (i, j) th element of the matrix K is stored in $\mathbf{k}[(i - 1) \times \text{tdk} + j - 1]$.		
<i>On exit:</i> if k is not NULL then the leading n by p part of k contains AK_i , the product of the Kalman filter gain matrix K_i with the state transition matrix A_i . If AK_i is not required then k must be set to NULL .		
17:	tdk – Integer	<i>Input</i>
<i>On entry:</i> the stride separating matrix column elements in the array k .		
<i>Constraint:</i> $\text{tdk} \geq p$ if k is defined.		
18:	h [p × tdh] – double	<i>Output</i>
Note: the (i, j) th element of the matrix H is stored in $\mathbf{h}[(i - 1) \times \text{tdh} + j - 1]$.		
<i>On exit:</i> if k is not NULL then the leading p by p lower triangular part of this array contains $H_i^{1/2}$. If k is NULL then h is not referenced and may be set to NULL .		
19:	tdh – Integer	<i>Input</i>
<i>On entry:</i> the stride separating matrix column elements in the array h .		
<i>Constraint:</i> $\text{tdh} \geq p$ if k and h are defined.		
20:	tol – double	<i>Input</i>
<i>On entry:</i> if both k and h are not NULL then tol is used to test for near singularity of the matrix $H_i^{1/2}$. If you set tol to be less than $p^2\epsilon$ then the tolerance is taken as $p^2\epsilon$, where ϵ is the machine precision . Otherwise, tol need not be set by you.		
21:	fail – NagError *	<i>Input/Output</i>
The NAG error argument (see Section 2.7 in How to Use the NAG Library and its Documentation).		

6 Error Indicators and Warnings

NE_2_INT_ARG_LT

On entry, **tds** = $\langle\text{value}\rangle$ while **n** = $\langle\text{value}\rangle$. These arguments must satisfy $\text{tds} \geq n$. On entry **tda** = $\langle\text{value}\rangle$ while **n** = $\langle\text{value}\rangle$. These arguments must satisfy $\text{tda} \geq n$. On entry **tdb** = $\langle\text{value}\rangle$ while **m** = $\langle\text{value}\rangle$. These arguments must satisfy $\text{tdb} \geq m$. On entry **tdc** = $\langle\text{value}\rangle$ while **n** = $\langle\text{value}\rangle$. These arguments must satisfy $\text{tdc} \geq n$. On entry **tdr** = $\langle\text{value}\rangle$ while **p** = $\langle\text{value}\rangle$. These arguments must satisfy $\text{tdr} \geq p$. On entry **tdq** = $\langle\text{value}\rangle$ while **m** = $\langle\text{value}\rangle$. These arguments must satisfy $\text{tdq} \geq m$. On entry **tdk** = $\langle\text{value}\rangle$ while **p** = $\langle\text{value}\rangle$. These arguments must satisfy $\text{tdk} \geq p$. On entry **tdh** = $\langle\text{value}\rangle$ while **p** = $\langle\text{value}\rangle$. These arguments must satisfy $\text{tdh} \geq p$.

NE_ALLOC_FAIL

Dynamic memory allocation failed.

NE_INT_ARG_LT

On entry, **m** = $\langle \text{value} \rangle$.

Constraint: **m** ≥ 1 .

On entry, **n** = $\langle \text{value} \rangle$.

Constraint: **n** ≥ 1 .

On entry, **p** = $\langle \text{value} \rangle$.

Constraint: **p** ≥ 1 .

NE_MAT_SINGULAR

The matrix $\text{sqrt}(H)$ is singular.

NE_NULL_ARRAY

Array **h** has null address.

7 Accuracy

The use of the square root algorithm improves the stability of the computations.

8 Parallelism and Performance

`nag_kalman_sqrt_filt_cov_invar` (g13ebc) is not threaded in any implementation.

9 Further Comments

The algorithm requires $\frac{1}{6}n^3 + n^2(\frac{3}{2}p + m) + 2np^2 + \frac{2}{3}p^3$ operations and is backward stable (see Verhaegen *et al*).

10 Example

For this function two examples are presented. There is a single example program for `nag_kalman_sqrt_filt_cov_invar` (g13ebc), with a main program and the code to solve the two example problems is given in the functions ex1 and ex2.

Example 1 (ex1)

To apply three iterations of the Kalman filter (in square root covariance form) to the time-invariant system (A, B, C) supplied in lower observer Hessenberg form.

Example 2 (ex2)

To apply three iterations of the Kalman filter (in square root covariance form) to the general time-invariant system (A, B, C). The use of the time-varying Kalman function `nag_kalman_sqrt_filt_cov_var` (g13eac) is compared with that of the time-invariant function `nag_kalman_sqrt_filt_cov_invar` (g13ebc). The same original data is used by both functions but additional transformations are required before it can be supplied to `nag_kalman_sqrt_filt_cov_invar` (g13ebc). It can be seen that (after the appropriate back-transformations on the output of `nag_kalman_sqrt_filt_cov_invar` (g13ebc)) the results of both `nag_kalman_sqrt_filt_cov_var` (g13eac) and `nag_kalman_sqrt_filt_cov_invar` (g13ebc) are the same.

## 10.3 Program Results

```
nag_kalman_sqrt_filt_cov_invar (g13ebc) Example Program Results
```

Example 1

The square root of the state covariance matrix is

```
-1.7223 0.0000 0.0000 0.0000
-2.1073 0.5467 0.0000 0.0000
-1.7649 0.1412 -0.1710 0.0000
-1.8291 0.2058 -0.1497 0.7760
```

The matrix AK (the product of the Kalman gain matrix with the state transition matrix) is

```
-0.2135 1.6649
-0.2345 2.1442
-0.2147 1.7069
-0.1345 1.4777
```

Example 2

Covariance matrix PE from nag\_kalman\_sqrt\_filt\_cov\_var (g13eac) is

```
1.6761 1.4744 1.2519 1.6852
```

|        |        |        |        |
|--------|--------|--------|--------|
| 1.4744 | 1.3646 | 1.1367 | 1.4651 |
| 1.2519 | 1.1367 | 1.0668 | 1.3445 |
| 1.6852 | 1.4651 | 1.3445 | 2.2045 |

Covariance matrix PF from nag\_kalman\_sqrt\_filt\_cov\_invar (g13ebc) is

|         |         |         |         |
|---------|---------|---------|---------|
| 5.0635  | -1.5512 | 0.0231  | 1.1756  |
| -1.5512 | 0.8503  | -0.0492 | -0.3631 |
| 0.0231  | -0.0492 | 0.0648  | -0.0217 |
| 1.1756  | -0.3631 | -0.0217 | 0.3336  |

Matrix U' \* PF \* U is

|        |        |        |        |
|--------|--------|--------|--------|
| 1.6761 | 1.4744 | 1.2519 | 1.6852 |
| 1.4744 | 1.3646 | 1.1367 | 1.4651 |
| 1.2519 | 1.1367 | 1.0668 | 1.3445 |
| 1.6852 | 1.4651 | 1.3445 | 2.2045 |

The matrix KE from nag\_kalman\_sqrt\_filt\_cov\_var (g13eac) is

|        |        |
|--------|--------|
| 0.3699 | 0.9447 |
| 0.3526 | 0.8199 |
| 0.2783 | 0.5375 |
| 0.1588 | 0.6704 |

The matrix KF from nag\_kalman\_sqrt\_filt\_cov\_invar (g13ebc) is

|         |         |
|---------|---------|
| -0.5857 | -1.4263 |
| -0.0280 | 0.2239  |
| 0.0170  | 0.1200  |
| -0.1405 | -0.4519 |

U' \* KF is

|        |        |
|--------|--------|
| 0.3699 | 0.9447 |
| 0.3526 | 0.8199 |
| 0.2783 | 0.5375 |
| 0.1588 | 0.6704 |
