

## NAG Library Routine Document

### F01VHF (ZTFTTR)

**Note:** before using this routine, please read the Users' Note for your implementation to check the interpretation of *bold italicised* terms and other implementation-dependent details.

#### 1 Purpose

F01VHF (ZTFTTR) unpacks a complex triangular matrix stored in Rectangular Full Packed (RFP) format to full format in a two-dimensional array. The RFP storage format is described in Section 3.3.3 in the F07 Chapter Introduction.

#### 2 Specification

```
SUBROUTINE F01VHF (TRANSR, UPLO, N, ARF, A, LDA, INFO)
```

```
INTEGER                N, LDA, INFO
COMPLEX (KIND=nag_wp) ARF(N*(N+1)/2), A(LDA,*)
CHARACTER(1)           TRANSR, UPLO
```

The routine may be called by its LAPACK name *zfttr*.

#### 3 Description

F01VHF (ZTFTTR) unpacks a complex  $n$  by  $n$  triangular matrix  $A$ , stored in RFP format to conventional storage in a two-dimensional array. This routine is intended for possible use in conjunction with routines from Chapters F06 and F07 where some routines that use triangular matrices store them in RFP format.

#### 4 References

None.

#### 5 Parameters

- 1: TRANSR – CHARACTER(1) *Input*  
*On entry:* specifies whether the normal RFP representation of  $A$  or its conjugate transpose is stored.  
 TRANSR = 'N'  
 The matrix  $A$  is stored in normal RFP format.  
 TRANSR = 'C'  
 The conjugate transpose of the RFP representation of the matrix  $A$  is stored.  
*Constraint:* TRANSR = 'N' or 'C'.
- 2: UPLO – CHARACTER(1) *Input*  
*On entry:* specifies whether  $A$  is upper or lower triangular.  
 UPLO = 'U'  
 $A$  is upper triangular.  
 UPLO = 'L'  
 $A$  is lower triangular.  
*Constraint:* UPLO = 'U' or 'L'.

- 3: N – INTEGER *Input*  
*On entry:*  $n$ , the order of the matrix  $A$ .  
*Constraint:*  $N \geq 0$ .
- 4: ARF( $N \times (N + 1)/2$ ) – COMPLEX (KIND=nag\_wp) array *Input*  
*On entry:* the  $n$  by  $n$  triangular matrix  $A$  in RFP format, as described in Section 3.3.3 in the F07 Chapter Introduction.
- 5: A(LDA,\*) – COMPLEX (KIND=nag\_wp) array *Output*  
**Note:** the second dimension of the array  $A$  must be at least  $N$ .  
*On exit:* the triangular matrix  $A$ .  
 If UPLO = 'U',  $A$  is upper triangular and the elements of the array below the diagonal are not referenced.  
 If UPLO = 'L',  $A$  is lower triangular and the elements of the array above the diagonal are not referenced.
- 6: LDA – INTEGER *Input*  
*On entry:* the first dimension of the array  $A$  as declared in the (sub)program from which F01VHF (ZTFTTR) is called.  
*Constraint:*  $LDA \geq \max(1, N)$ .
- 7: INFO – INTEGER *Output*  
*On exit:* INFO = 0 unless the routine detects an error (see Section 6).

## 6 Error Indicators and Warnings

Errors or warnings detected by the routine:

INFO < 0

If INFO =  $-i$ , argument  $i$  had an illegal value. An explanatory message is output, and execution of the program is terminated.

## 7 Accuracy

Not applicable.

## 8 Further Comments

None.

## 9 Example

This example reads in a triangular matrix in RFP format and unpacks it to full format.

### 9.1 Program Text

```

Program f01vhfe
